SUMMARY AND CONCLUSIONS

i. The limited land and other resources available to support its rapidly growing population make El Salvador's development process particularly difficult. Moreover, the economy has depended heavily upon the state of world markets for its two main crops, coffee and cotton. Its entrepreneurs and labor force, however, have been important assets. Between 1960 and 1967 El Salvador has been able to maintain an average growth rate of over 6 percent due in large part to the rapid industrialization based upon exports to the Central American Common Market (CACM). Following the development of strains within the CACM as a result of balance of payments difficulties and uneven growth registered among the partners, hostilities broke out between El Salvador and Honduras in 1969. These circumstances resulted in the partial breakdown of the CACM arrangements, and El Salvador's growth slowed markedly. During 1968-72 the growth in output did little more than keep pace with the 3.5 percent annual increase in the population.

ii. The situation has been improving, however, in the last two years. Although in 1972 the economy was held back by the drought which affected agriculture, in 1973 the growth rate increased to more than 5 percent. Both public and private investment expenditures have been increasing. Manufacturers have been successful in opening up new export markets outside the CACM area; the markets for the traditional exports, coffee and cotton, have been favorable.

iii. In 1972 the Government announced an investment program for the 1973-77 period and has taken a number of important steps toward its implementation. Improvements in tax administration increased budgetary revenues (although receipts from the coffee export tax, which is linked to world prices, have also been a major factor). A number of important institutional changes were made in the financial sector; these include creation of a Monetary Board, a Social Fund for Housing, the Agricultural Development Bank and the Guarantee and Finance Fund for Small Business. Financial and monetary management, while continuing in El Salvador's essentially conservative tradition, have paid increasing attention to development objectives.

iv. Achievement of a more satisfactory rate and pattern of socio-economic development in El Salvador will depend heavily upon the policies followed in the agricultural sector and upon the ability of the Government to implement its public sector investment program. Agricultural reform has been at the core of political and economic debate in El Salvador for many years, but up until now no basic decision has been adopted. The present rural poverty, the pressure of population upon the limited land and the limited ability of other sectors to provide the needed employment opportunities, add to the urgency of an adequate program in this area. Regarding the Government's program in other areas, the greatest difficulties are likely to be in preparing and implementing the specific projects upon which it depends. Adequate external resources are likely to be available for well-conceived projects. Public sector finances are in a comparatively strong position at present, although higher levels of investment will call for some new tax measures.

v. Despite the increase in petroleum prices, El Salvador's balance of payments position is strong and is likely to remain so over the next few years. High prices for coffee and cotton along with increasing disbursements on development loans from international institutions and bilateral agencies are contributing to this situation. Over the longer run, however, the continued expansion of non-traditional exports to markets outside the CACM is essential. El Salvador's external public debt is relatively small and generally on soft terms; debt service has been about 3 percent of export earnings and is likely to remain at about this level in the next several years.

vi. The prospects for El Salvador are good over the next several years. It should not be difficult to maintain a growth rate of 6.5 percent. A higher rate of growth would be possible, while at the same time making significant progress in expanding opportunities for the poorer classes and maintaining reasonable internal and external financial stability. This would require, however, particular attention to a program to improve conditions in the agricultural sector and to the strengthening of the capacity to prepare and implement specific development projects.

ECONOMIC MEMORANDUM ON EL SALVADOR

Chapter I: INTRODUCTION

1. El Salvador has only 4.5 percent of the Central American Common Market area, yet it maintains 23.2 percent of this area's population. The population density is more than 176 persons per square kilometer, the highest on the continent. This high concentration has made the Salvadoreans use the land available to them nearly to the maximum. The value of output in relation to land area is over US$60,000 per square kilometer, well above any other country on the American continent except the U.S.A.; however, annual income per head is still only US$320.

2. The country is divided into three main regions by two mountain ranges that stretch from east to west. While the principal food crops, corn and beans, are grown everywhere, the south coastal plains specialize in cotton and sugar production; the rich volcanic soils of the center are used for coffee, the main export crop, while in the northern part cattle raising and food crops predominate. It has 21 volcanos, source of geothermal energy which are starting to be tapped with the financial support of the World Bank. This could add to the country's comparative advantage in attracting foreign investment. Due to El Salvador's abundant and capable labor force and proximity to the U.S.A. market, a number of assembly plants have already been established.

Chapter II: ECONOMIC DEVELOPMENT

3. The gross domestic product of El Salvador grew at an average rate of 6.5 percent per annum from 1960 to 1967. Subsequently, the rate of growth decelerated; the economy grew at an average rate of only 4.1 percent per annum from 1967 to 1972. The more rapid rate of growth registered for the earlier period was mainly due to the industrialization that took place under the protective umbrella of the Central American Common Market, a process supported by generous industrial incentives. Many industries were established to produce import substitution goods for the CACM area. However, by 1968 the Common Market started to face some internal problems created by some of the countries' balance of payments imbalances and the uneven growth registered among the partners. This situation resulted in the re-imposition by Honduras of import duties on Central American produced goods. Trade between Honduras and El Salvador came to a halt after a war broke out in July 1969 between these two countries; the delays in a political settlement between them are causing corresponding delays in the restructuring of the CACM arrangements which seems essential if intraregional trade expansion is again going to be an important impetus to growth. Output in the agricultural sector has been subject to large fluctuations, but its average annual growth rate has been about 3.5 percent. The rate of growth of GDP for 1973 is estimated at more than 5 percent, an improvement achieved mainly because of the recuperation in the manufacturing activities, a process that started in 1971 and despite the still low level of growth in the agricultural sector.

Agriculture

4. The share of the agricultural sector in GDP dropped from about 31 percent in 1960 to about 24 percent in 1973. However, more than 60 percent of the population lives in the rural area and about 47 percent of the active labor force works in this sector. Agricultural production can be divided into two types: the basic grains - corn, beans, rice - which are produced by small farmers in all parts of the territory, and the export crops - coffee, cotton, sugar - which are produced mainly by larger landholders.

5. Most of the growth in agricultural production during the first part of the 1960's was in the export crops. Basic grains production, although subject to violent year-to-year fluctuations, grew by about 2.0 percent per annum on average from 1960 to 1969. This slow growth, substantially below the rate of growth of population of about 3.5 percent per annum, made it necessary to import these grains in increasing amounts. In 1970, however, the authorities decided to promote the production of the basic grains, with the aim of making the country self-sufficient; this policy was due to the break in trade relations with Honduras, previously its main supplier of these products. The Government introduced credit facilities, and promotion and extension programs aimed at stepping-up the production of these grains. The results have been successful so far. Between 1970 and 1973 the average rate of growth in the production of basic grains was 9.5 percent per annum, despite the drought that hit Central America in 1972 and made the production of basic grains in El Salvador drop by about 35 percent in that year.

6. The Government continues to promote the production of the basic grains. They have recently revised the support prices paid by IRA (Regulatory Supply Institute) in order to bring them nearer the world market prices for these grains. The Central Bank has agreed to provide financial resources to help IRA fulfill its commitments. (However, it is certain that the IRA will not have enough storage capacity if the producers decide to sell to it in large quantities.) The Central Bank has, as well, lines of credit available to the commercial and mortgage banks to enable them to participate in the promotion of these crops. The Agricultural Development Bank (see "Money and Banking"), in addition to providing credit facilities, has stocked substantial amounts of fertilizers, seeds and other inputs, which are now scarce and increasing in price. With these stocks it is able to provide its clients with some of the inputs in the quantitites they need at favorable prices.

7. Although the Government is actively promoting the production of basic grains, there is a danger, as has happened before, that areas that were previously planted with corn and beans will be diverted to cotton production in view of its present high price. The prices that will be paid for the basic grains in the internal market, especially the prices that will be guaranteed to the producers, will be an important factor in the allocation of the land between basic grains and cotton. So far, there are no signs of the above diversion happening since the planting season has not yet started.

8. Production of export crops, which are about 60 percent of total sector output, has grown at about 6.5 percent per annum on average for the last 13 years, with fluctuations through the period due to international market conditions and variations in weather conditions. These crops are grown on relatively large land holdings, using modern technology, and have always counted on substantial financial support from the banking system. Coffee and cotton account for about 80 percent of the banks' portfolio in the agricultural sector. (See section on "Balance of Payments" for a discussion of the major export crops.)

9. Land tenure and land use have been the subject of much discussion for many years in the political and economic life of El Salvador. Some experiments have taken place on a limited scale to make land available to the landless rural population. The ICR (Rural Colonization Institute) was established in December 1950, replacing the Social Improvement Institute which in its turn had replaced the Social Improvement Fund established in 1932 as a response to the serious social disturbances in the rural area that erupted that year. The basic idea of these institutions has been to acquire large rural estates and distribute them among the landless. However, the amount of land they have distributed has not been large enough to make any significant impact. The present Government initiated its term by expressing strong support for an agriculture reform; however, there is as yet no clear policy as to the content of the reform. The scarcity of land, the relatively large and growing rural population, the importance of increasing farm output, and the limited employment opportunities in non-farm activities combine to demand an energetic, but carefully balanced policy in this field.

10. Although the possibility of bringing new areas into production is limited, there are still opportunities for increasing output through irrigation, introducing better techniques in the areas where basic grains are cultivated and by stopping land erosion and over-use.

Manufacturing

11. When the Central American Common Market was established in 1960, El Salvador had a manufacturing sector that accounted for about 14 percent of the GDP. Endowed with an aggressive entrepreneurial group as well as a relatively large and fast growing population, El Salvador immediately seized the opportunity created by the enlarged market to accelerate its industrial growth. By 1967, the value of manufactured output had doubled. Growth in industrial production slowed in 1968 and, in 1969, output barely increased. The Salvadoreans immediately started to look for alternative markets for their manufactures in view of the problems plaguing the Common Market. By 1971, the manufacturing sector was growing again, although not as rapidly as in the pre-crisis period. The bulk of the manufacturing production has been concentrated on food processing, beverages, textiles and clothing; since the mid-1960s the production of chemicals, such as cosmetics and insecticides, has become important. Most plants at present

are reported to be operating at full capacity. Cotton consumption by the textile industry is expected to increase from 60,000 bales in 1973 to 90,000 bales in 1974. The chemical manufacturers have been stocking large quantitites of raw materials to avoid shortages in the future in view of good prospects for their products.

Investment

12. Investment expenditure closely follows the pattern described in the development of the industrial output. Gross fixed capital formation remained at about 15 percent of GDP at current terms from 1960 to 1967, dropped drastically to about 11 percent in the crisis years, and in 1971 it started recuperating. Fixed investment expenditure reached 15 percent of GDP in 1972 and 16 percent in 1973. The public sector investment has accounted for about 25 percent of the total gross fixed capital formation and has fluctuated pari-passu with that of the private sector. The investment in inventories has varied substantially from year to year, a drastic reduction having occurred in 1972, mainly of agricultural products due to the drought and to the large sales of coffee stocks to new markets.

13. Foreign capital is being attracted to El Salvador in view of its inexpensive, capable and abundant labor and its nearness to large markets. At present there is a new electronic assembly plant in operation, a large new clothing factory is ready, the chemical industry is enlarging its capacity and there are reports of several new investments in the textile industry. The banks, in general, report demand for credit to buy new equipment and machinery. In order to further encourage the establishment of new export industries in the country, the Government expects to promulgate a new Industrial Law in the coming months. (See Chapter on "Balance of Payments" for a more detailed discussion.) The construction industry is very active; and the building of condominiums is now fashionable in San Salvador. The construction industry is expected to receive an additional push from the Social Housing Fund, established last year to build and promote the construction of houses for workers. (See "Money and Banking" for a more detailed discussion of the Fund.)

Chapter III: PUBLIC FINANCE

14. The fiscal policy of El Salvador has been conservative and cautious, aiming at balancing the Government budgets or maintaining deficits at a minimum. In pursuing this policy the Government was more ready to make adjustments on the expenditure side, especially in investment expenditures, than on the revenue side. Budgetary savings have remained at about 1.4 percent of GDP, except for 1965 when they were 2.7 percent and 1973 when they reached 2.5 percent. External credit has financed on average one-third of the Central Government investment expenditure. The main budget items, expressed as a percent of GDP, are summarized in Table 1.

Table 1: CENTRAL GOVERNMENT BUDGET SUMMARY

(Main items as a percent of GDP)

	1965	1966	1967	1968	1969	1970	1971	1972	1973

Source: Appendix tables 2.1 and 5.1; components may not add because of rounding and the capital receipts not shown.

Current Revenue

15. Current revenue from 1965 to 1972 grew at about the same rate as GDP, while in 1973 it registered an unprecedented increase of more than 23 percent, well above the growth of GDP of about 11 percent (in current terms). This and the improvement already registered in the previous two years, are a consequence of some unforeseen international developments in the world market for coffee and to some important tax and administrative measures taken by the Government.

16. The main tax measures taken in 1970-73 were (a) a substantial increase in the stamp tax rates (September 1970); (b) a small increase in the cigarettes tax rates (December 1972); and (c) a small increase in the motor-vehicle tax rates (November 1972). In 1972 the Government initiated a series of administrative measures designed to improve the efficiency of the tax collecting offices and to encourage and stimulate the tax-payers to fulfill their tax duties. Among the more important measures taken in this area are (a) automatic processing of the information that allows a more efficient check on the tax-payers; (b) the introduction of auditing programs for direct and indirect taxes; and (c) the establishment, through the Register and Special Control Law of the Revenue Service, of a system of tax-payer identification numbers. Through these administrative measures, the revenue service was able to increase the number of tax-payers from 40,000 to more than 90,000, while the authorities estimate that the cost of tax collection

was reduced from about 4 cents per colon to 3.2 cents between 1971 and 1973. In addition, the Government initiated a very comprehensive publicity campaign through the mass media to persuade tax-payers to comply with their obligations. The revenue service has provided assistance to tax-payers through offices which have been established in commercial banks throughout the country.

17. The 1973-77 Development Plan calls for substantial increases in Government revenue in order to be able to finance the large investment expenditure projected while still maintaining El Salvador's tradition of financial stability. The authorities are aware that this cannot be done by relying solely on administrative measures. They are considering the introduction of some new tax measures such as (a) export duties on cotton and sugar which will vary on a progressive basis according to prices on international markets and the costs of production, (b) a sales tax that could eventually replace the present stamp tax, and (c) higher taxes on imported luxury goods. The approval of tax legislation, however, in the case of El Salvador is made more difficult by the fact that the National Assembly is elected every two years, so that practically every other year is a "political year".

Current Expenditure

18. Current expenditure grew at an uneven rate from 1965 to 1973; on average, the annual growth rate for this period was higher than that of GDP. Central Government consumption expenditures grew at about 4.3 percent per annum from 1965 to 1970, but after 1970 this rate of growth increased to more than 11 percent per annum. In 1971 the higher rate was mainly due to the salary adjustments granted to doctors and nurses; general increases for teachers and a salary increase for Government employees earning less than ₡300 (US$120) a month accounted for a substantial part of the 1972 rise in current expenditures. Further salary adjustments were registered in 1973. Current transfers have fluctuated considerably but have generally been increasing; thus transfers to the rest of the public sector more than doubled from 1965 to 1973. The authorites believe that there is room for some saving on the current account by cutting unnecessary expenditures. Significant cuts, however, appear rather unlikely.

Investment Expenditures

19. Central Government capital expenditures have increased substantially in the last two years, having passed from 2.3 to 3.6 percent of GDP between 1971 and 1973. Figures for the capital expenditures for the rest of the public sector are not available for 1973, but (excluding those financed by transfers from the Central Government) they were 2.5 and 2.6 percent of GDP, respectively, in 1971 and 1972. Thus, total public sector capital expenditures are now slightly above 6 percent of GDP. Based upon the 1973 budget results and projected disbursements from foreign loans committed as of December 31, 1973, it should be possible for El Salvador to maintain investment expenditures at about this level over the next few years without

significant additional effort in mobilizing either internal or external resources. It should be possible for El Salvador not only to achieve, but to surpass, the objectives outlined in the 1973-77 Development Plan. The latter would require a more intensive effort in project preparation and implementation plus, as the program proceeds, some increased mobilization of domestic resources. The investment of some of the autonomous public entities has been stepped-up in the last three years, and it is expected that this level will be maintained in coming ones. CEL (Lempa River Hydro-electric Commission) is planning to advance its construction plans in view of the unexpected increase in the prices of oil and also in the demand for energy. New industrial plants are being installed in the country more rapidly than had been expected, and previous plants, which used to generate their own electricity, are considering buying their energy from CEL.

Chapter IV: MONEY AND BANKING

20. Monetary policy has reinforced budgetary policy in the achievement of the price stability that El Salvador maintained up to 1972. In 1973, however, the wholesale price index jumped by about 19 percent. This was largely the effect of higher world prices; the export sector was unusually liquid at the same time as there were large increases in the prices of imported finished goods and raw materials. Another basic concern of the monetary authorities has been to foster economic development, an area in which the Central Bank has played a key role.

21. From 1966 to 1972 the monetary liabilities of the banking system (currency, sight, time and saving deposits) grew at a slightly higher rate than GDP in current terms; that is, at 6.6 percent per annum. This moderate growth rate drastically changed in 1972, when the money supply increased by more than 22 percent, and in 1973 when it grew by nearly 19 percent. These drastic changes were the result of the dramatic improvement which occurred in the international markets for the Salvadoreans' exports, so that the net international reserves of the banking system increased by more than ₡51 million (US$20.4 million) in 1972. In 1973, however, the authorities decided to use their high reserves to fight inflation and to hedge the economy against the threat of future international shortages by stockpiling basic inputs for the agricultural and manufacturer sectors.

22. The Central Bank net international reserves, after achieving an all-time record level of ₡182 million (US$72.8 million) in December 1972, continued increasing up to May 1973 when they reached more than ₡252 million (US$100.8 million), after which they started to decline. The decline was partly due to the cancellation of some foreign long-term debt of the Central Bank. The Central Bank as well opened an extraordinary line of credit to the commercial banks to allow them to lend these resources to their clients for the purpose of building up inventories of imported raw materials and other necessary inputs for the industrial and agricultural sectors. A necessary condition for the use of these resources was that the borrowers

Source: Table 6.1.

should prove they are increasing their inventories beyond normal levels. Another important factor in the reduction in the level of reserves in the second half of 1973 was the fact that El Salvador did not export its cotton harvest in view of a dispute over prices which arose between the Salvadorean Cotton Cooperative and some foreign buyers. This last factor also explains the large increases in the financial resources provided by the Central Bank to the commercial banks, which had to finance the cotton inventories.

23. Credit from the Central Bank to the Government was drastically reduced last year, as a consequence of the unexpected Government revenue increase due to the high prices obtained by coffee in the international markets (since the tax rate increases with prices) and to the improvements in tax administration.

24. The commercial banks' liquidity position registered moderate increases during 1972 and the first three quarters of 1973. The expanding level of economic activity in 1972 kept the demand for credit at a high level,

so that the excess liquidity of the banks did not constitute a serious or long-lasting problem. The Central Bank created new certified papers to be bought by the commercial banks to allow them to reduce their idle balances, but the problem did not reach any substantial dimension and the commercial banks bought only around ₡5 million (US$2 million). By October 1973, the liquidity position of the commercial banks was completely reversed, due to a strong demand for credit from the private sector to cope with the usual seasonal increase at harvest time, but in addition to some of the factors already mentioned. The commercial banks, which had reduced substantially their short-term foreign liabilities to about ₡7 million (US$2.8 million) by mid-year; increased it to ₡52 million (US$20.8 million) by December in order to supplement their resources.

25. The authorities have put ceilings on the amounts that the banks are allowed to lend for the import of passenger cars, household electrical equipment and air tickets, for the purpose of using the foreign reserves to the best advantage of the country, and in view of the substantial increase in the import of some of the above-mentioned non-essential products and services.

26. In February 1974 the authorities introduced some new policy measures aimed at adjusting the system to the new level of prices in the economy and providing additional financial resources for the Government investment program projected in the Economic Development plan. Thus, the authorities raised the general level of interest rates by about 1 percent. The development-oriented portfolio requirement for the commercial banks, under which they had to lend a minimum of 70 percent of their resources for priority purposes, was changed. The portfolio requirement for priority purposes has been increased to a minimum of 75 percent. Of this new level, a minimum of 8 percent has to be invested in Government bonds issued to finance the investment program. The insurance companies, which are under the same portfolio requirement for the investment of their technical reserves, will have to invest 15 percent of the 75 percent in the above-mentioned Government bonds. These new percentages should be achieved before July 31 for the banks and December 31 for the insurance companies. The 8 percent requirement for investment in Government bonds can be reduced by the amounts that the banks sell to the public.

27. Several institutional changes have taken place in El Salvador during the past year. In August the Government established a Monetary Board which assumed the responsibility of formulating general monetary and credit policies - functions many of which had been vested solely in the Central Bank Board. In addition, the Board has the capacity of changing the parity of the national currency without ratification by another public body. The Monetary Board is headed by the President of the Republic; it includes the Ministers of Economy, of Finance and of Agriculture, as well as the Executive Secretary of CONAPLAN and the President of the Central Bank (who acts as its secretary.)

28. In May 1973, the Government established the Social Fund for Housing (FSV), with the purpose of providing adequate housing facilities for workers. Although the law talks of workers in general, in its first stages of operation the Fund will be concentrating its efforts in the urban areas due to some practical difficulties that have to be solved before covering the rural workers. The two main resources of this Fund are a ₡25 million subsidy provided by the Government (to be disbursed in annual installments over five years) and a 5 percent payroll tax on the wages and salaries of workers included in the social security system (all but one-half of one percent to be paid by the employer.)

29. In April the Government established the Agricultural Development Bank (BFA) as the institution with the legal and financial capacity to meet the credit needs of agriculture, especially small farmers; in addition, it is the financial agent of the entities endowed with the task of carrying on programs of rural development and structural changes of the rural area. The resources of the BFA come from the former Small Farmers Welfare (ABC) institution which was absorbed by the new institution and from the Central Reserve Bank (which transferred the special agricultural funds it had operated). The Central Reserve Bank will continue to provide resources to the BFA out of its annual profits. The BFA has three main types of operations: first, financial management of the government resources provided for the agriculture reform (ICR resources); second, credit and related services and facilities for the small and medium size farmers, except coffee growers; and thirdly, credit facilities for large farmers and agro-industries, on terms and conditions similar to those of the commercial banks. These commercial-type operations are expected to provide the Bank the profits necessary to cover the losses it expects on operations with the small farmers in view of the heavy administrative costs of the latter.

30. Finally, in the first half of 1973, the Government established the Guarantee and Finance Fund for Small Business, which absorbed the Guarantee Fund for Small Industry previously operated by the Central Bank. The Fund provides credit to small commercial and industrial enterprises and cooperatives. It also guarantees loans made by public and private institutions to small enterprises.

Chapter V: BALANCE OF PAYMENTS

31. Between 1970 and 1972 El Salvador's balance of payments position was relatively strong; reserves grew by more than US$35 million due to the rapid growth of export earnings while imports were increasing only moderately and capital inflows were high. In 1973, however, the Banking System reserves dropped by more than US$20 million. This reflected the large increase in the value of imports as a consequence of the higher prices of imported manufactures, raw materials and petroleum as well as the policy of the Government to encourage stockpiling of imported inputs and the fact that the last cotton harvest was not exported.

Exports

32. During the last 13 years, El Salvador has been able to make substantial progress in diversifying its exports. In 1960 coffee and cotton accounted for nearly 80 percent of exports, while industrial export products accounted for only about 14 percent. By 1972 the share of coffee and cotton had fallen to about 56 percent while industrial export products had increased to more than 37 percent.

33. Coffee exports still remain the most important single source of foreign currency. Its introduction as a large-scale commercial crop goes back more than half a century. Coffee farms stretch across the slopes and valleys of the highland center of the country and dominate the economic and social life of most rural communities. Coffee is ecologically well-suited to the steep terrain and local climatic conditions of the country, which explains why the natural fertility of the area has been maintained even with intensive use of land. Recently, there has been an increase in investment credit for the coffee growers, mainly to replant old areas.

Table 3: PRINCIPAL EXPORTS

(In millions of US dollars)

Source: Table 3.2.

The Salvadoreans have developed a new planting technique that allows more densely planted areas yielding higher production. Coffee exports have remained at about 115 million kilograms since 1967, with the exception of 1972 when El Salvador sold part of its large coffee stocks to new markets (which explains why the average unit value of coffee for El Salvador in that year was reduced despite the good prices that prevailed in the traditional markets). It is expected that coffee production will continue to grow slowly, mainly by increases in productivity, up to a maximum of some 140 million kilograms. Prices are expected to remain high during the next several years.

34. Cotton is the second most important export. It was not until the years immediately before and during the Second World War that growing cotton on a large scale began. Its cultivation stretches along the Pacific coastal plain, previously covered only by forest or used as grazing land and for production of basic grains. The introduction of insecticides and the strong demand for cotton during the war years were the principal factors that promoted its cultivation. Since the beginning of the large-scale production of cotton the Government has felt it necessary to regulate and encourage its production in view of the importance of the product for the economy of the country. Consequently the Government established the Cotton Cooperative in 1940, to which all growers must belong and which, in addition to providing some services such as ginning and marketing, is responsible for implementing Government regulations on cotton growing. Cotton production and exports have fluctuated substantially due to the changes in the international market prices and to insect plagues that have attacked the crops. Since 1969, however, the exports have been steadily increasing - until last year, when a dispute between the Cotton Cooperative and some foreign buyers over the cotton price on some future sales contracts prevented part of the 1973/74 harvest from being exported. The Cooperative because of the sharp rise in world prices of cotton, fertilizers and insecticides, wished to renegotiate contracts which had been concluded earlier on the basis of different cost and price expectations. Future prices are expected to remain high, and the value of cotton exports is expected to more than double in 1974 and remain at that new level for the next few years.

35. The exports of industrial products (excluding sugar) grew at more than 23 percent per annum between 1960 and 1968. Nearly all of these were directed to the Central American Common Market. In 1969 and 1970, as a consequence of the Common Market crisis and the Honduras-El Salvador war, the exports to the CACM area declined moderately. By 1971 exports of industrial goods were growing again. El Salvador started to penetrate markets outside the area and, within the CACM, was able to increase sales to other countries to compensate for the loss of Honduras' market. The above developments have reduced the share of El Salvador's exports going to the CACM area. Thus, in 1968, more than 40 percent of total earnings from merchandise exports came from sales to the Central American Common Market, while by 1973 this share was reduced to about 31 percent. It is expected

that this trend will continue in view of the present aggressive policy of the Government to open new markets outside the Central American Common Market. The authorities are working on a new law to promote the establishment of industrial plants to produce export items. The main features of the law are that it (a) classifies the firms in different categories, (b) provides incentives, essentially fiscal ones, varying according to contribution to employment and raw material use, (c) establishes free-zones to promote the location of assembly plants, (d) creates an export insurance system, (e) creates a council on export promotion composed of ministers and the secretary general of the Planning Offices, and (f) creates an institute to promote exports. The Government expects this law to be passed in the coming months.

Imports

36. Total imports followed a trend similar to that of exports. They grew by about 9 percent per annum from 1960 to 1967, stagnated from 1968 to 1970, and then grew at an average rate of more than 14 percent per annum in 1971 and 1972. In 1973, imports gew by more than 33 percent due to the sharp increases in the prices of many products, the strong demand for raw materials by industry and agriculture, and the Government policy of encouraging stockpiling to fight inflation and prevent unemployment which might arise from possible future shortages of some raw materials and intermediate products in the international market. The Government is now trying to curb the import of non-essential goods through an advance deposit requirement and it is considering introducing taxes on consumption of imported non-essential goods. It is anticipated that the value of imports will continue to grow at a rapid rate in view of the expected high level of economic activity in all the sectors of the economy as well as the likely further increases in international prices.

37. In the last two years, El Salvador imported more than 430 thousand tons of crude and partially refined oil per annum, at an annual cost of about 10 million dollars before the price increases registered in the last quarter of 1973. These imports averaged about 4 percent of total import value and are expected to reach 7 percent in the coming years. As long as the prices of El Salvador's principal primary product exports - coffee and cotton - remain high, and exports of manufactured goods continue to expand relatively rapidly, El Salvador should not have difficulty in meeting the higher costs of its fuel imports.

Current Account Financing

38. From 1966 to 1971 the current account deficit was mainly financed by a large inflow of private capital (including public sector borrowing from non-official sources in 1968-69). This trend, however, was reversed during the last two years, when the international financial institutions and bilateral agencies stepped-up their disbursements, while there was a substantial repayment of loans to private institutions by the private and public sector. The structure of the public debt has always been very favorable, and in view of the above-mentioned developments, it registered a modest improvement in the last few years in grace period and maturity.

39. The debt service ratio on public loans, with the exception of 1971 and 1973 - when there were large repayments to private foreign banks - has remained on average at about 3.1 percent since 1966. It is projected that the debt service ratio will remain below 3.0 percent for the next three years. The foreign reserves of the banking system were US$52.7 million at the end of 1973, that is, about 6 weeks of imports of goods on non-factor services. It is projected that the level of reserves will increase modestly, enabling them to remain at about 6 weeks of imports.

The Balance of Payments Outlook

40. Assuming cotton and coffee prices stay at high levels, no balance of payments difficulties are likely in the next few years. Over the longer run, El Salvador's ability to finance its growing import requirements will depend heavily upon success in expanding non-traditional exports to countries outside the CACM area. It is expected that substantial use will be made of international and bilateral development loans in order to finance the 1973-77 Development Plan. Because of the country's poverty and continued heavy dependence upon exports of coffee and cotton, El Salvador should continue to receive part of its external financing upon concessionary terms.

STATISTICAL APPENDIX

1/ Assumes an annual growth ra[illegible] percent in real terms plus the rate of growth in prices as in the IBRD Index of International Prices of April 8, 1974.

2/ Assumes that the accumulat[illegible] stocks will be high in 1974 as in the previous year (Central Bank projection), in 1975 imports will not grow in real terms, in 1976 imports will grow [illegible] same rate ofGDP, that is 6.5 percent. Prices are projected on the basis of the IBRD Index of International Prices of April 8, 1974.

3/ Assumes the same rate of growth in the value of merchandise.

4/ Assumes it will grow at the IBRD Index of International Prices of April 8, 1974.

5/ Assumes 10 percent of profit remittances over the previous year's direct investment.

6/ Assumes a 10 percent annual increase calculated over the average of the last five years starting in 1974.

7/ Assumes an increase of 10 percent per annum in current terms over the average of the whole previous period (1966-73)

8/ Assumes new commitments of US$20, 25 and 30 million and disbursements of 10%, 20% and 25% for 1974, 1975 and 1976. This is recorded in a separate line below as new loans, net. The rest is calculated on the basis of the commitments up to December 31, 1973 and the average pattern of disbursement for each particular international, bilateral, or private institution.

9/ Residual.

1/ Includes fresh fruits, sesame seeds, balsam, and others.

Notes for Table 3.2: EL SALVADOR - VALUE, VOLUME AND UNIT VALUE OF PRINCIPAL EXPORTS

Part B: 1972, 1973 (preliminary) and projected 1974-76

1/ Assumes that the volume produced will register very modest gains in the next three years. Prices are projected using IBRD commodity forecasts and the Index of International Prices of April 8, 1974.

2/ It is expected that the area will not increase in the next campaign 1974/75, due to the uncertainties as to the price of future cotton internally, since the cooperative will not be able to sell in the future because of the present conflict with foreign buyers, especially Japan. This situation is expected to be over by 1976, the year in which the area could be increased by 10,000 manzanas. Exports in 1974 are expected to increase substantially in volume due to the accumulated stocks carried in 1973, due to the conflict mentioned before. Prices were projected using the IBRD commodity forecasts and the index of international prices of April 8, 1974. For 1974, however, it is expected that the average unit price will be 10% below the otherwise expected normal price, because El Salvador is selling to new areas because of an international boycott organized against its cotton.

3/ Assumes a modest gain in volume for 1974. Prices are projected applying the rate of growth projected for beef in the IBRD commodity forecasts of April 8, 1974.

4/ Assumes an increase of US$0.5 in 1975.

5/ Assumes a growth rate of 10 percent per annum 1974 and 1975, and 8 percent for 1976. Prices are projected using the IBRD commodity forecasts and the Index of International Prices of April 8, 1974.

6/ Assumes that volume will grow at 5 percent per annum over a new base calculated as the average of the last five years. Prices are projected on the basis of Index of International Prices of the IBRD of April 8, 1974.

7/ Assumes that volume will grow at 10 percent per annum the first two years and 5 percent the third, over a new base calculated as the average of the last three years.

8/ Assumes that volume will grow by 15 percent in 1974, 10 percent in 1975 and 5 percent in 1976. Prices are projected using the IBRD Index of International Prices, applied over the average of the last five years.

9/ Assumes that volume will grow at 7 percent per annum. Prices are projected applying the IBRD Index of International Prices to last year's price.

10/ Assumes a 5 percent annual rate of real growth, plus the rate of growth in the IBRD Index of International Prices.
