SUMMARY AND CONCLUSIONS

Background

i. El Salvador has registered significant economic gains since 1960. The economy's long-term economic growth rate has been 5.3 percent a year during 1960-77, which, in spite of a rapid rate of population growth, has brought about a 2.1 percent per annum increase in per capita incomes. During this period, exports and investment have been the major engines of growth. While exports represented 22 percent of GDP in 1960-62, they reached 36 percent of GDP by 1975-77. At the same time, investment growth outstripped GDP growth and raised the investment/GDP ratio from 14 percent in 1960-62 to 21 percent in 1975-77.

ii. El Salvador's underdevelopment is evident from a variety of indicators. El Salvador still has one of the lowest income levels among the countries in the Western Hemisphere with an estimated per capita income of US$570 in 1977 1/. It has one of the highest population densities (205 per square kilometer) and only a third of a hectare of arable land per capita, and population growth remains high. Nutritional standards are low while protein and calorie deficiencies are common. Roughly 68 percent of the dwellings are without piped water and 55 percent without electricity. The illiteracy rate is high. Income is highly concentrated. Living conditions and incomes in rural areas, where about 60 percent of the population lives, are consider-

ably worse than in the cities.

iii. Rapid population growth is the country's most fundamental long-run problem, given the country's size and the natural resource base. Declining fertility would have a decisive role in shaping the economic and social needs of the country by the year 2000. Thus, accelerating the fertility decline, initiated a few years ago, can make an enormous difference to the end numbers of the total population. Lower fertility reduces future population pressures on a scarce resource base, lowers the dependency burden; decreases consumption and investment needs, slows growth of the pool of job-seekers, and decreases the potential for continuing high population growth. Although the main purpose of this report is to review the recent economic performance and the medium-run outlook of the Salvadorian economy, an analysis of the longer-term problems created by rapid population growth and their economic and social effects is presented in sections II to V.

iv. The economically active population is increasing at over 3 percent a year. The economy, nevertheless, has managed to employ large numbers of additional workers with significant labor-absorption in the informal sector. Open unemployment rose from 5.1 percent in. 1961 to 11.8 percent in 1971 2/ but declined to about 5.2 percent in 1975.

v. Agriculture is the most important sector of the economy with about one-fourth of GDP, one-half of the employed economically active population, and two-thirds of export earnings. Arable land is limited with about 2-3 hectares of land per agricultural worker. Agricultural production has

1/ World Bank Atlas Methodology.

2/ 1971 Population Census, Vol. II.

a dualistic pattern. Export crops are produced mostly in large farms (over 100 ha) while basic grains are mainly produced in small farms (below 10 ha).

vi. Manufacturing accounts for about one-fifth of GDP, and one-tenth of the employed labor force. It is highly concentrated in the San Salvador metropolitan area. Manufacturing production and employment have fluctuated during 1960-77, particularly when the conflict with Honduras resulted in the loss of the Honduran market. Furthermore, manufacturing exports to the CACM have reached a stage of diminishing opportunities for easy regional import substitution, which, given a growing labor force and a limited agricultural resource basis, creates the need of developing manufactured exports to third market countries in order to absorb the additions to the labor force.

Government Development Policies

vii. The role of the public sector in the economy has been traditionally limited until recently, when the Salvadorian Government has attempted to play a more active development role. This is reflected both in the increased level of Government expenditures and in the more development-oriented policies, particularly for agriculture and manufacturing. Historically, Government expenditure policies have been very prudent (total expenditures at 12 percent of GDP), with expenditures closely matching revenues. In the last few years, however, as revenues expanded rapidly, expenditures have increased faster, reaching 15-16 percent of GDP, with most of the increase allocated to capital expenditures.

viii. Whilst agricultural sector policies during the 1960s were mainly

concerned with export promotion, they have been recently more concerned with land distribution, with incomes of small landholders, and with increasing the domestic supply of staple foods from limited arable land. Efforts to implement a significant land reform in 1976, however, failed because of strong resistance from large landowners. The new administration has re-directed its efforts to change the land tenure system through a new bank (COFINTA), which will acquire and redistribute land to small agricultural entrepreneurs. The Government contribution to COFINTA over a five-year period will total US$40 million. Additional resources are expected to be obtained through bond issues and domestic and foreign credits. At the same time, the new administration has programs to raise living conditions in the Northern Zone, which covers about 40 percent of the country's land area and has a larger proportion of very small farm units.

ix. Manufacturing policy during the 1960s and early 1970s was mainly concerned with incentives to promote manufactured exports within the Common Market. As export growth to this market slowed, the Government made efforts to stimulate exports elsewhere. It attempted to promote labor-intensive industries through generous incentives, free trade zones, and improved services to industry. This program has not been very successful, partly due to the general investment climate and partly to the indus-trialists' orientation to the CACM.

x. With regard to family planning programs, the Government is now

giving active support to these programs with some success. An estimated one-fifth of the 1977 fertile female population has been reached by public and private family planning programs. By 1982, about 30 percent of the fertile female population is expected to participate in the programs.

Recent Economic Developments

xi. During 1976 and 1977, sharp increases in coffee prices brought about a significant improvement in the balance of payments and a much strengthened fiscal situation. As Government revenues increased, public investment expanded significantly. Real GDP growth at 4.5 a year in 1976-77, however, was below the 5.4 percent a year recorded during 1970-75. This was the result of a drought that reduced agricultural output, and the slowdown of private investment, primarily due to the uncertain political climate. Inflation accelerated to 12 percent in 1977 compared to 7 percent in 1976 owing to sharply increased prices of basic grains and other food products, because of a shortage in domestic supply; the high level of liquidity brought about by the large coffee export earnings; and rising import prices. The balance of payments' current account in 1976-77 was in virtual equilibrium, recovering from unusually high deficits in 1974 and 1975. In spite of a large increase in imports, net foreign exchange reserves stood at US$247 million at the end of 1977 (representing about two and a half months of imports of goods and services). With regard to the Central Government finances, the budget was in surplus in 1977 as the total tax burden increased from 12.4 percent of GDP in 1975 to 16.6 percent in 1977. As revenues expanded, 1977 Government capital outlays in nominal terms increased 35 percent a year with respect to the 1975 level.

xii. The economic situation was less favorable in 1978. GDP growth

is estimated at about 4.4 percent owing to the decline in coffee prices, the effects of the weather on some crops, and a lower growth rate of investment. In the first half year, the balance of payments deteriorated significantly owing to a policy of withholding coffee from sale by the Salvadorian Coffee Company, speculating on the expectation of a future price rise. Foreign exchange reserves declined to about US$142 million at the end of June. Although coffee sales were resumed in September, the balance of payments in 1978 showed a large current account deficit (about US$240 million). Foreign exchange reserves increased by about US$29 million, because net inflows of foreign credits, much of it to the Central Bank, were larger than the current account deficit. Central Government finances deteriorated; current savings declined to 2.5 ,percent of GDP and the overall deficit reached 1.9 percent of GDP because of much lower coffee tax receipts, partly due to the postponement of coffee sales, and a substantial increase of current expenditures for wages and transfers. Tax measures increased personal and medical income-tax deductions and transformed the specific rate tax on beer and soft drinks into an ad-valorem tax.

xiii. In 1978, the Government launched its 1978-82 Development Program. Public fixed investment levels reached about e 480 million, in spite of the difficulties encountered in the initial stages of implementing new policies and programs. Relative shares were: infrastructure 63 percent, social

investments 22 percent, productive investments 8 percent, and public admini-

stration 6 percent. Financial investments for housing were large (about
 100 million) reflecting the growing importance of public housing institutions.

Growth Prospects for 1979-82

xiv. The medium-term economic outlook is closely related to export growth, basically coffee and manufactured exports, and to the investment performance. Coffee export earnings would depend, on one hand, on coffee prices, which are expected to decline during the next few years and, on the other hand, on exported volumes, which are expected to increase by 7.8 percent a year as production rises from the low 1977-78 level following the traditional expansion pattern. Manufactured exports would depend significantly on CACM prospects and the effective promotion of labor-intensive manufactured exports to third market countries. Public investment is expected to have a significant role in the performance of the economy as the public sector's share of total fixed investment is projected to increase from 32 percent in 1978 to about 40 percent in 1982. Private investment trends would be related to the evolution of the political climate. On the basis of the present prospects for export and investment growth prospects and the recovery of agricultural production, GDP is expected to increase at only 4.5 percent a year during 1979-82.

xv. In 1979-82, declining coffee prices coupled with high levels of imports, due to a rising public investment, a higher domestic demand, and to rapidly increasing prices and currency realignments in the developed countries, are expected to bring about increasing deficits in the current account of the balance of payments. To reduce the expected deficits, the Government needs to increase exports, mainly labor-intensive manufactures, agricultural exports

and tourism, and slowdown the growth of non-essential consumer goods imports through credit restrictions, higher interest rates, and fiscal measures.

The current account deficits, nevertheless, are expected to be larger than in the past and would require use of foreign credits in larger quantity than has been the usual. As a result, the debt service ratio, which is rather low (6 percent in 1977), may double by 1982. In this context, the country needs to expedite negotiations with the sources of concessionary financing to reduce the impact of the new external borrowings on the debt service.

Development Strategy and Public Investment

xvi. The Government's strategy in the 1978-82 Development Plan is to expand the country's productive capacity and create employment by supporting industrial and agricultural growth with large investments in infrastructure, larger credit availabilities, and an increased supply of trained manpower.

At the same time, the Government seeks to raise living standards, incomes and productivity with a particular emphasis on the Northern Zone. Finally, population growth is receiving increasing attention because larger fertility declines would play a significant role in reducing the population expected by 2000 and thus in shaping the size of the economic and social needs of the future population.

xvii. El Salvador's ability to achieve its development objectives in the next few years would be closely related, in addition to the evolution of coffee markets and prices, to the success in making significant progress on the following issues:

(a) restoring the private investor confidence;

(b) accelerating manufacture growth, particularly of labor intensive manufactures, for export to third market countries, as a source of employment and foreign exchange;

(c) stepping up rural development efforts in order to improve living conditions of the peasants and meet the domestic demand for food and raw materials;

(d) generating adequate public earnings to cover the local counterpart funds required by the investment program;

(e) analyzing thoroughly public investment projects and their relative priorities, improving project preparation, and having clearly defined projects to meet chosen targets.

The most serious issues are the need to restore the private investment climate, which has been weakened by political unrest and the need to promote industrial exports, particularly outside the CACM.

xviii. The Government's investment programs support the Plan's strategy for the productive sectors with significant investments in infrastructure and larger credit availabilities for agriculture and industry, and also supports the plan's social policy with investments in housing, education, health, water and sewerage. Taking into account the status of the projects and the financial and administrative capacity, a scaled-down public investment program, which totals about e 6.3 billion, is projected for 1978-82. About 71 percent represents fixed investments, of which infrastructure represents 43 percent, social investments 31 percent, and the productive sectors, most of the remainder. This distribution represents a change from earlier patterns of public investment that had larger percentage allocations for infrastructure.

However, actual investments may be lower and show a higher infrastructure component since these are sectors where Government executing capacity is well established. Agriculture and social sectors have a weak executing capacity, which needs immediate attention. In addition, there is a need for more clearly defined programs and projects to fulfill the targets of the Development Plan. Regional and urban planning mechanisms are also weak and need to be strengthened. Furthermore, the priority of some projects included in the investment program is questionable, such as the Northern Longitudinal Highway under construction which parallels the Pan American and Littoral Highways; the feasibility of the fertilizer and sponge-iron plants needs to be carefully evaluated.

Financing the Investment Program

xix. Given the large increase in public investment, the Government would need to increase public savings, which, on the Central Government side, will be affected significantly during 1979-82 by the decline in coffee prices. Coffee taxes contributed about 35 percent of total Central Government revenues in 1977, but with high marginal tax rates, declining coffee prices will substantially reduce coffee-tax revenues. Savings of the rest of the public sector will be determined mainly by two autonomous agencies (ISS and INPEP), which expect increasing revenues and savings from expanded coverage of a growing labor force, and by public enterprises, which will need to increase savings substantially through tariff revisions and expanded operations, particularly

in CEL, ANDA, ANTEL and CEPA. Given recent cost increases, tariff revisions have become more urgent. Strengthening the financial position of public enterprises would diminish the need for current and capital transfers from the Central Government, thereby increasing the financial resources available for other economic and social programs.

xx. Additional Government revenues to finance the investment program might be obtained from the following tax measures: either a substitution of a sales tax for the present stamp tax or an increase in the stamp tax rate; increasing selective consumption taxes; transforming the specific excise taxes on liquor, alcohol, and petroleum products into ad-valorem taxes to avoid the deterioration of real revenues by inflation; and a tax on urban property. With the recent decline in coffee tax receipts, implementation of tax-revenue measures becomes more urgent.

xxi. An annual growth rate of 4.5 percent over the next five years is not a bright prospect for El Salvador. Indeed, it contrasts with the official estimate of 6 percent, which reflects the Government's view of what would be necessary to generate substantially more jobs in both urban and rural areas and provide sufficient resources for a more dynamic development program. The fall in coffee prices, expected slow growth in crucial private investment in manufacturing, and the resulting short-term prospects for the needed takeoff in manufactured exports to CACM and other markets means that El Salvador will be a foreign exchange constrained economy over the next five years. While the debt service ratio may double as borrowing is accelerated, it should still be quite manageable. El Salvador should do everything possible to accelerate exports beyond the rates projected in this report and increase the share of its public investment program that includes projects

suitable for financing by official and concessionary lenders. Nevertheless, it is clear that the country will need as much long term and concessionary finance as can be marshalled. Its limited per capita physical resources, continued rapid population growth, substantial rural and urban poverty, and problems in overcoming the initial stages of establishing a dynamic series of manufactured exports indicate the need for such support. Its external resource need, the limited import content of many social programs, and fiscal needs indicate that official lending should also be used to supplement local currency costs, especially in support of social programs.

I. INTRODUCTION

1. This Economic Memorandum updates and reviews short term developments and prospects for the next few years of the Salvadorian economy. It also analyzes the longer-term problems created by rapid population growth and their economic and social effects in order to identify related issues or specific development problems that merit follow up study. In this context, further work is expected to be carried on by the World Bank on the rural-urban dynamics of population growth and its socio-economic effects.

II. GROWTH TRENDS AND RECENT ECONOMIC DEVELOPMENTS

A. Growth Trends

Long-Term Trends

2. El Salvador has registered reasonably good output expansion since 1960. During 1960-77, the economy grew at 5.3 percent a year which, in spite of a substantial population growth, meant a 2.1 percent a year improvement in

per capita output. Investment growth at 6.9 percent a year outstripped GDP growth and raised the investment/GDP ratio from 14 percent in 1960-62 to 21 percent in 1975-77. Domestic savings financed most of the increased investment. Agriculture's share of GDP declined in real terms from 33 percent to 21.7 percent, while industry's share rose from 19 percent to 25.7 percent 1/. With the exception of the last few years, prices remained relatively stable. Faced with a rapidly increasing population, the economy nevertheless managed to employ large numbers of additional workers. In 1975 the urban unemployment rate was a relatively low 6.8 percent. In both urban and rural areas, however, there was substantial underemployment.

3. Besides expanded investment, exports were an additional engine of growth, and the economy has become progressively more open. While exports were 22 percent of GDP in 1961-62 and imports were 23 percent of GDP, the same ratios in 1975-77 were 35 percent and 37 percent respectively. Although the share of coffee and cotton has not declined in current prices owing to the recent sharp increase in coffee prices, underlying quantum trends show a movement toward diversification. The ratio of exported volumes of coffee and cotton to the total volume of exports declined from over two-thirds in the early 1960s to less than half in 1975-77 while the ratio of the export volume of manufactured goods climbed from about a tenth to a third respectively. 2/ The expansion of industrial exports during the 1960s was assisted

1/ Industry includes manufacturing, mining, power, and construction.

2/ At current prices, the share of coffee and cotton increased to over 65 percent in 1976 and 1977 mainly because of very high coffee prices (see para. 25 on total exports). As coffee prices decline, it is expected that the share of coffee and cotton exports in total exports

at current prices would decrease again.

by the creation of the Central American Common Market (CACM). In the 1970s, the momentum of expansion has slackened in the CACM, but the growth of manufactured exports to third markets has helped maintain the rapid development of the sector.

Recent Developments

4. More recently, the economy has been recovering from difficulties experienced in 1975, when the country's terms of trade declined with the general world recession. The pace of economic activity quickened thereafter when coffee prices increased sharply. GDP growth, however, averaged 4.5 percent in 1976-77.

5. The recent recovery has been less strong than it might have been for two reasons. First, since 1975 the country has suffered a prolonged drought, which has severely affected agricultural production. Agricultural output declined by 3.0 percent a year in 1976-77 compared to the 4.7 percent growth achieved in the previous five years. Production declines were recorded for all agricultural products except beans and livestock. The country's economic recovery has thus rested on high and continued expansion in the industrial and service sectors, which grew by 7.6 percent and 6.7 percent during 1976-77 respectively. Second, the country has experienced a gradual slowdown of private investment, especially in new industrial enterprises, by both domestic and foreign concerns, essentially due to a lack of confidence arising from political uncertainties. 1/

6. The main force of the recovery in 1976-77 came from exports. Prices of coffee and cotton, the two main exports, increased significantly between 1975 and 1977, by nearly 400 percent in the case of coffee, and a more modest 40 percent in the case of cotton. These price increases more than offset drought-related production declines and thus export earnings in current prices increased by 38 percent in 1976 and by a further 28 percent in 1977. Considerable dynamism was also imparted by high levels of public investment which grew by 65 percent in real terms in 1975, and from this high base decreased by 10 percent in 1976 and increased by 37 percent during 1977. Private investment growth, as noted above, slowed down in 1976-77. Most important was a drop in industrial investment and a deceleration in private construction activity. 2/

1/ In the last three years, there have been growing political incidents, including the assassination of Government officials, kidnappings of businessmen, and confrontations with peasants as a result of farmers' dissatisfaction over land distribution issues.

2/ As measured by permits approved and by floor space built.

7. In 1978, the economic situation was less favorable, with real GDP growth at about 4.4 percent because of the decline in coffee prices, the effect of the continued drought in some crops, and a slower growth rate of investment. Exports at constant prices and public consumption increased. In the first six months, the balance of payments deteriorated significantly as coffee was withheld from the export market and imports continued to grow.

However, in September coffee sales were resumed and the Monetary Board tightened credit restrictions. By year's end the current account of the balance of payments showed a large deficit of US$239 million. Central Government savings also deteriorated as a result of lower coffee tax receipts and a substantial increase of current expenditures for wages and transfers. Tax measures increased income-tax deductions and transformed the specific rate tax on beer and soft drinks into an ad-valorem tax.

B. Public Finances and Investment

The Role of the Public Sector

8. After more than two decades of slow growth, the public sector in recent years has undertaken a more dynamic development role. This is noticeable both in the higher level of Central Government expenditures and in the increasing importance of public enterprises.

9. Since 1973 the Central Government has been expanding its development activities. In earlier years, current revenues and expenditures and the fixed investment of the Central Government maintained rather constant and low ratios to GDP (current revenues were 11-12 percent of GDP; current expenditures were 9-10 percent, and fixed investment was 1-2 percent). With external borrowings at low levels, capital expenditures fluctuated with the availability of current savings. In 1973, the Government decided to commit more public resources to development, and by 1975 its capital expenditures ratio doubled proportionately to GDP with respect to the 1970 ratio. The remarkable upsurge in coffee prices in 1976 and 1977 brought about a much improved financial position. Current revenues increased to 16.6 percent of GDP in 1977 and, although current expenditures rose at a slightly higher rate than the GDP growth rate, current savings increased to over 7.0 percent of GDP, and capital expenditures (includ-

ing capital transfers) to about 5 percent. In 1978, government receipts fell along with coffee prices. Rising current outlays also reduced government savings to 2.5 percent of GDP. In spite of the sharp savings decline, Central Government fixed investment dropped only slightly to 2.8 percent of GDP.

10. The more active development role of public enterprises and autonomous agencies is reflected in a rising level of infrastructure investment, particularly in power generation, ports, airports, and telecommunications, and in the creation of specialized agencies such as a Foreign Trade Institute and a Social Housing Fund.

Source: Central Bank, Ministry of Planning and Ministry of Finance.

The Financial Position of the Central Government

11. During 1961-72, the Central Government's financial policy kept overall cash deficits (excluding amortization of the debt) very low; close to 1 percent of GDP. Slightly larger deficits occurred during the 1973-77 Development Plan, when the Government undertook a more active development policy. In 1976-77, with much larger coffee revenues, Central Government finances strengthened significantly and, by 1977, the overall cash budget was in surplus. The Treasury's cash balances increased by about US$40 million in the two-year period even though disbursements from external credits remained low (at an average of about US$15 million) and utilization of domestic credit (from floating debt, Central Bank advances, and bond sales) decreased.

12. As a result of the cautious expenditure policy, capital outlays have been adjusted traditionally to the availability of current savings and, thus, external borrowings have been low, except during 1973-75 when the heightened development activity required a relatively greater utilization of external credits. The heavy reliance on current savings to finance capital expenditures has meant a tight current expenditures policy; as a result, Central Government savings increased from 19 million colones in

1970 to 106 million colones in 1975 and 512 million colones in 1977 (in 1970 prices, savings increased about 15 times, from 19 million colones in 1970 to 285 million in 1977).

13. Current revenues grew at about the GDP growth rate until recent years when tax collections rose significantly owing to higher coffee prices; better tax administration; some tax reforms, such as the tax on sugar exports; and the revenue effects of a tax amnesty 1/. As a result, the coffee-tax burden increased from 1.3 percent of GDP in 1970 to 6.4 percent of GDP in 1977, while the non-coffee tax burden increased from 9 percent to 10.1 percent, with domestic transactions taxes compensating for the decline in import taxes due to industrial incentives and free trade in the CACM.

14. Because traditional Government expenditure policy has been to closely match revenues, during 1960-71, Government expenditures were not very dynamic and remained below 12 percent of GDP. As Government revenues expanded during 1972-77, expenditures increased faster than GDP, with the pace quickening in the last two years (from 10-11 percent of GDP in the 1960s to a 15 percent in 1976-77). The Central Government allocated most of the increase to capital expenditures. In real terms, total expenditures increased at a rate of 6.3 percent a year during 1970-77, with capital expenditures growing at a rate of 25.6 percent a year and current expenditures at 4.4 percent a year. Among current expenditures, total payments for real wages and salaries increased by only 2.9 percent a year, but expanded Government employment, at about 5.1 percent a year during 1972-77, brought about a decline in real wages for individual government workers. It has, thus, been difficult to retain professionals,

technicians and high-caliber administrative personnel. There is now a pressing need to raise the real salaries of qualified personnel of the public administration.

15. As a result of the Government attempts to provide social services to an expanding population and to accelerate rural development, public real expenditures for education, health and agriculture increased during 1970-77, reaching respectively 3.9 percent, 2.5 percent and 1.6 percent of 1977 GDP. Of these, the National University accounted for 0.7 percent of GDP and the Social Security Institute's health expenditures for about 1 percent of GDP.

The Financial Position of the Decentralized Non-financial Public Sector

16. The decentralized non-financial public sector is composed of autonomous agencies, public enterprises and local governments. Current savings of autonomous agencies are closely related to the performance of the Social Security Institute (ISSS) and the recently created Public Employee Pension Fund (INPEP). During 1976-77, savings of these two agencies expanded considerably, reaching about 056.8 million (0.9 percent of GDP) in 1977. The remaining autonomous agencies have very small savings, depending on government transfers to cover most operating expenditures and investments. Of these, the Salvadorian Institute for Agricultural Transformation (ISTA) and the Salvadorian Tourism Institute (ISTU) made significant capital expenditures in the last few years. (See Statistical Appendix, Table 5.10.)

1/ Legislative Decree No. 248 permitted taxpayers to amend income and property tax declaration without penalty.

17. The public enterprises' current savings declined in 1975 because tariff adjustments lagged behind cost increases. Following tariff increases, savings recovered during 1976-77. The main revenue-producing public enterprises are: the power company (CEL), the telephone company (ANTEL), the port authority (CEPA), the water supply company (ANDA) and the regulatory supply institute (IRA), but only CEL and ANTEL showed substantial savings in 1977. Investments of public enterprises have been very dynamic since 1973, mainly owing to the expansion programs of CEL, CEPA and ANTEL. (See Statistical Appendix Table 5.10.)

18. The Municipalities' current revenues are small; their revenue sources are mostly municipal fees. Payments arrears are significant. As a result, expenditures are low and the savings capacity is small, and municipal services are inadequate. In order to undertake even modest investments, the municipalities need capital transfers from the Central Government. These have been low in recent years, only 1.6 percent of fiscal outlays in 1977.

The Financial Position of the Financial Public Sector

19. The financial public sector is active in financing agriculture, industry and housing. INSAFI, FIGAPE, VFA and FNV have small operating surpluses. Fondo Social de la Vivienda (FSV), however, has a substantial current surplus of about V40 million a year because its revenues include a payroll contribution.

20. INSAFI, a Government-owned DFC, made significant contributions to medium- and long-term industrial financing during the 1960s. During the 1970s, however, INSAFI's performance has been affected by financial and managerial problems. When some of INSAFI's past borrowers could not repay, INSAFI took

over the floundering enterprises, which resulted in a significant managerial burden and the conversion of lending capital into equity. Further managerial and financial needs have resulted from its responsibility for public industrial projects, such as the financially weak Jiboa sugar mill. INSAFI's lending activities have now been circumscribed, and in effect now do not differ much from commercial banking practices.

21. FIGAPE, a Government-owned DFC, assists small enterprises, including manufacturing firms with assets below □100,000 and above V3,000. A restructuring of its law is under consideration to raise the upper limit for loans. FIGAPE, like INSAFI, has experienced financial and administrative difficulties.

22. BFA, the state-owned agricultural bank, plays an increasingly important role in channeling credit to agriculture. Its lending program expanded at 12 percent a year during 1973-77; by 1977 it provided 25 percent of agricultural lending. BFA assists small farmers, who until 1973 did not have significant access to institutionalized agricultural credit. So far BFA has had a satisfactory performance based on sound administrative procedures. It has not shown operational losses and its default rate, about 5 percent, has been modest.

23. FSV, a social housing fund, was created in 1973 to help increase the housing supply for industrial and commercial workers. It is funded by a 025 million Government contribution and payroll contributions of 5.5 percent on salaries (5 percent by employers and 0.5 percent by employees.) FSV's fixed investment for housing is significant, about 050 million in 1977.

Public Investment

24. During most of the 1960s and early 1970s, public fixed investment was low and inadequate to meet the growing needs of the expanding population. During the middle 1970s, public fixed investment, however, has increased rapidly as a result of improvement in public finances and the more dynamic development policy initiated with the 1973-77 Development Plan. With the exception of housing all sectors received substantial real increases in investment 1/. The greatest increases came in power, transport, and telecommunications however, where the absorptive capacity was highest. Nevertheless, social and direct production outlays also grew significantly from a very depressed 1970 base.

Table 2: PUBLIC SECTOR FIXED INVESTMENT

(million 1970 colones)

	1970	1977	Annual Growth Rate 1970-77
Infrastructure	27.6	129.6	24.7
Social Sectors	18.5	62.4	18.9
Productive Sectors	9.7	47.2	25.4
Other	6.8	12.1	8.6
Total	62.6	251.3	22.0

Source: Table 5.12

Infrastructure investments for power, transport, and telecommunications increased their share of total investment from 45 percent in 1965-67 to 55 percent in 1973-77 reflecting the Government efforts to provide adequate infrastructure for private sector growth. The productive sectors increased

their share of public investment because the Government changed its policy toward agriculture in 1973 and also because of its investments in industrial concerns, such as the Jiboa sugar mill.

C. Balance of Payments

25. Balance of payments trends have been largely determined by exports of a few major primary commodities, of which coffee is the most important. Coffee exports increased from 91 thousand metric tons in 1960 to 120 thousand

1/ Financial investment for housing, however, increased significantly.

in 1970 and 154 thousand in 1976; they declined in 1977 to 135 thousand tons owing to adverse weather. The peak export level was reached in 1972 with 158 thousand tons. Because of favorable prices, however, the share of coffee in total exports, which had been declining for years, recovered in 1976 and 1977 to the levels of the early 1960s. Cotton exports expanded rapidly from 1960 to 1965 but rising costs and declining price expectations lowered production in the late 1960s. Production recovered in 1970s as cotton prices increased. Sugar exports increased from 10 thousand tons in 1960 to about 133 thousand tons in 1977. Declining prices in the last few years slowed down production and exports. Manufactured exports to the CACM developed rapidly during the 1960s. The loss of the Honduran market and the transport difficulties with other members of the CACM slowed industrial exports in 1969 and the early 1970s. Manufactured exports (in real terms) to the CACM recovered some dynamism beginning in 1973. Manufactured exports to third countries also

increased in the last few years although their contribution to total manufactured exports is still modest. Non-food manufactured exports to third countries increased from US$5 million in 1971 to US$12 million in 1973 and to US$24 million in 1977 (about 6 percent of total non-food manufactured exports). At current prices, the share of manufactured exports, which earlier had gained ground, however, came down significantly during 1976 and 1977.

Table 3: EXPORTS OF GOODS AND NFS

Source: Central Bank.

26. The current account has been carefully controlled by the Central Bank through monetary policies (reserve and portfolio requirements of commercial banks, selective import deposits) designed to curtail imports; particularly during an export downswing. Furthermore, as noted earlier,

the Central Government's prudent financial policies have helped maintain domestic credit expansion within limits compatible with monetary and balance of payments stability. With the exception of 1974 and 1975, when exceptional circumstances prevailed, current account deficits have been mostly below 3 percent of GDP and, in a few years, surpluses have been recorded. External borrowing has been limited by a reluctance to borrow abroad.

27. Whilst deficits have been conservatively managed, rapid export growth has allowed equally rapid increases in imports. Especially important have been increases in imports of capital and intermediate goods favored by generous incentive policies. Import deposits of 100 percent and selective consumption taxes ranging between 5 and 30 percent have, however, been applied on non-essential consumer goods leading to declining shares of consumer goods in the total import bill. Food imports have fluctuated with domestic crops, but the long-term trend has been a reduction in their share of total imports; basic grains programs are behind some of these results in spite of significant drought problems in recent years.

28. After experiencing unusually high deficits in 1974 and 1975 due to a slack in foreign demand and to fast rising import prices (mainly for crude oil and derivatives), sharp increases in coffee prices brought about a significant improvement in the balance of payments in 1976 and 1977. The current account was in virtual equilibrium in spite of large increases in imports. Net foreign exchange reserves stood at US$205 million at the end of 1977, representing about two and a half months of imports of goods and

services.

29. In 1978, the current account of the balance of payments deteriorated in the first eight months. Declining coffee prilces in the international market led to a policy of withholding coffee sales on the expectation of better future prices. Foreign exchange reserves declined to about US$141.9 million at the end of June 1978. Coffee sales resumed and the monetary authorities imposed credit restrictions to reduce the demand for imported goods. The merchandise account, however, showed a large deficit by the end of the year and, as a result, the current account deficit reached US$239 million. Foreign exchange reserves, nevertheless, recovered to about US$234 million.

III. DEMOGRAPHIC TRENDS, POLICIES, AND PROSPECTS

A. Population Growth

30. Although the main purpose of this report is to review the recent economic performance and the medium-run outlook of the Salvadorian economy, the following sections highlight the problems created by long-term population growth trends and their economic and social implications. El Salvador has an extraordinary large relative population size and growth which, given the country's resources and spatial dimensions, decisively frames most major policy decisions. The country's 1977 population was 4.2 million, growing at about 3.3 percent yearly 1/, and the country density is about 198 persons per

1/ The natural increase is about 3.3 percent a year but net migration reduces the growth rate to 3.0 percent.

square kilometer of land. Even if a targeted fertility decline of about one-third occurs 1/ by the year 2000, the country will have a population of about 7.7 million people or about 367 persons per square km of land.

1976 Population Densities for Selected Countries

Country	Pop. Per Sq. Km
Korea	323
Taiwan	390
Japan	280
Honduras	23
Nicaragua	15
El Salvador	192
El Salvador (2000)	367

31. Population growth of this magnitude will place severe pressures on natural resources, particularly agricultural land and water resources; the demand for utility and social services; and opportunities for gainful employment. Moreover, given the scarcity of agricultural land, and the current limited prospects for land redistribution, these pressures will most likely occur alongside rapid urbanization. In this setting it is imperative that government programs focus on the twin and inter-related issues of reducing population growth to its lowest possible level and developing strategies to provide basic services for the growing population.

32. The country has now reached that phase where both birth and death rates are declining. Fertility peaked in the early 1960s; since then, the crude birth rate has dropped from a high of about 50 births per 1,000 population to 40 in 1978. Mortality experienced a sharper decline, albeit spread over a larger period, from about 33 deaths per 1,000 in 1920 to an officially

estimated level of 8 per 1,000 in 1978. Life expectancy is about 62 years.

33. The drop in fertility is a very promising sign; it is usually much more difficult to initiate the decline than to accelerate it once it begins. The Government and CELADE consider feasible a one-third decrease in the crude birth rate (a crude birth rate target of 35 per thousand by 2000) but even a 50 percent reduction (a crude birth rate target of 28 per thousand by 2000) is attainable with stepped-up family planning programs. El Salvador should aim for the lowest fertility target; indeed, its short-term contraceptive prevalence goal of 29 percent by 1982 implies a crude birth rate of 35 per thousand, which is the target for 2000.

34. Some fertility correlates indicate which policy instruments could be used to reduce population growth. Rural women display significantly higher fertility than their urban counterparts; the crude birth rate is 46-47 per thousand in rural areas, 34-35 in urban areas and 31-33 in the San Salvador Metropolitan area. Fertility rates are significantly lower for

1/ More accurately the gross reproduction rate, or the number of daughters a woman would have under prevailing fertility conditions; the one-third reduction is a feasible target and under the assumptions used would entail a population growth rate of 2.4 percent per annum.

literate females and also decrease with the level of schooling. Female fertility is also highest in areas of low female participation in the labor force. 1/ The impact of mortality on fertility is also clearly important; with higher

infant and child mortality in rural areas, women have more children to obtain the desired family size. Rural areas lack many basic public services, especially in nealth, education, and family planning. A concerted attempt to improve coverage of the rural population (and especially rural females) in these areas could have a major effect on fertility rates.

35. The Government has displayed a growing awareness of the population problem and is now giving its active support to family planning programs. The office of the Population Commission Technical Committee, located in the Office of the Vice President, is in charge of developing and coordinating all projects and programs aimed at reducing population growth, including possibilities for emigration to less densely populated countries. The major focus of the unit is, however, to reduce fertility through family planning programs, health education in schools and clinics, and a large mass communication program. The implementing agencies are the Maternal/Child Health Unit of the Ministry of Health, the Social Security Institute and the Salvadorian Demographic Association. A break-down of domestic funds allocated to family planning is not available since these services are provided jointly with other health and education services. External support, on a grant basis, mainly from USAID, the United Nations Family Planning Agency, and the Planned Parenthood Federation, reached US$2.8 million in 1978.

36. There is evidence to show that the Government's programs to date have been relatively successful. Sample surveys show a very high level of awareness of family planning in both rural and urban areas. Contraceptive usage shows a dramatic rise (from 14.2 percent of women in the fertile age groups in 1975 to nearly 20 percent in 1977) with three-quarters being serviced by the Ministry of Health and the Social Security Institute and the rest by the

Salvadorian Demographic Association. The Government's planned target for contraceptive prevalence is 29 percent by 1982, a target which is attainable and may be surpassed. Sterilization has proved to be a particularly popular form of contraception (with about 44 percent of female birth control practitioners),2/ especially among older females who have achieved or exceeded desired family size. Family planning efforts, however, usually succeed best where living standards rise and access widens to basic services.

37. Although reported death rates are somewhat low there is still room for significant improvement in health conditions and medical care, and thus for further,decreases in mortality. Mortality continues to be highly concentrated amongst infants and pre-school children, with two-fifths of all annual deaths occurring in this group. Differences in death rates between the towns particularly the San Salvador Metropolitan Area (SSAM), and the countryside are substantial; rural infant mortality rates may be as much as 40 percent higher than urban rates. 3/ The major causes of death and of

1/ McGreevey, W., Population Dynamics and Policies, El Salvador, May 1974.

2/ Encuesta Nacional de Fecundidad y Planificacion Familiar, de. El Salvador, 1975.

3/ Puffer, R.B. and Serrano, C., Caracteristics de la Mortalidad en la Ninez, PAHO, 1973.

illness in El Salvador are gastro-intestinal and respiratory diseases and it is clear that better environmental sanitation, provision of safe

water supplies, the control of waste disposal, etc. could effect a significant reduction in the death rates. Various projections of the course of mortality in El Salvador, assuming continued improvements in health services suggest that a death rate of 5 per thousand can be attained by 2000.

B. Spatial Distribution of Population

38. El Salvador has three distinct population zones. The 'least densely populated area in the northern band (mostly the Departments of Chalatenango, Morazan and Cabanas), where the land is not very fertile, subsistence farming predominates, and relatively small acreages are in permanent crops. Urban centers are rather small and the population is predominantly rural. The presence of greater economic opportunities in other parts of the country has led to a continuous and strong emigration towards the center. The Central Zone has the main population centers: San Salvador Metropolitan Area (SSMA), Santa Ana and San Miguel. The SSMA has a significant concentration of economic activity, the highest levels of infrastructure and social services and is the seat of Government. With 40 percent of the urban population, SSMA is the country's most dynamic growth center, followed, at a distance, by Santa Ana and San Miguel, relatively large towns which developed initially as agricultural towns and are now developing small industrial bases. Rural income is also highest in this zone, which has good soils and offers substantial employment opportunities. The Coastal Zone is characterized by concentration of land ownership. About a third of rural families are landless and another third own less than 1 ha. Rural incomes are low, although somewhat above those of the Northern Zone. The land is fertile and the employment potential is significant. About 19 percent of total rural families are in the area. Urban development has accelerated in recent years in small centers

(Sonsonate, Zacatecoluca, Usulutan, Acajutla, and La Union). These towns have some agroindustrial bases but are closely linked to commercial crops, such as cotton, coffee, and sugar.

39. The most prominent fact of urban development has been the population growth of the SSMA, which has a population of more than five times the size of the next largest city. One in every three persons living in San Salvador in 1971 was born outside the metropolitan area. Smaller towns had lower growth rates during 1950-71 than the urban and country average as their inhabitants migrated to the larger urban centers, particularly the SSMA. The factors behind this population movement seem to be higher incomes for marginal urban dwellers than marginal rural dwellers, particularly in the SSMA. A second factor is the faster growth of job opportunities in the main cities because of the development of the fastgrowing manufacturing exports (largely an SSMA phenomenon) and fewer prospects for gainful employment in rural areas due to the population pressures on arable land and the concentration of rural property. A third factor is the concentration of social services in the urban areas.

40. In spite of this migration, El Salvador still ranks among the Latin American countries with the lowest proportion of urban population (35 percent of the population in cities of over 10,000 people compared to an average 71 percent for Latin America in 1970). The future likely pace of urbanization,

however, will be more rapid, since there is a significant latent potential for

a rural exodus. Projecting past trends leads to the prediction that at least 47 percent of the population will live in towns by 2000. This projection implies a rural population of about 4 million, which is close to the present total Salvadorian population, and about double the present rural population. This growth will lead to ever-mounting pressures on the limited land, a deterioration in rural living conditions, widened urban/rural income disparities and accelerated migration to the cities. Given the limited agricultural resource base, the country inevitably will need to turn to the export of manufactures to increase incomes. These employment-generating industries will be close to urban centers, strengthening the relative attractiveness of the cities. For these reasons, urban migration is likely to accelerate even more, raising the proportion of urban population above 50 percent by 2000. An expected value, based on cross-country analysis indicates a range of 50 to 55 percent for a country like El Salvador. 1/

IV: THE EFFECTS OF POPULATION GROWTH ON ECONOMIC AND SOCIAL DEVELOPMENT

41. In the long run, population growth is El Salvador's most fundamental problem. Four population projections have been prepared by CELADE and the Ministry of Planning with significant differences in the assumptions about fertility declines. The first projection assumes that fertility remains constant at the 1965-70 level through the end of the century; the other three projections assume that fertility will drop over the remaining years of the century by one-fifth, one-third, and one-half. Implicit crude birth rates for 1995-2000 are 39, 35 and 28 per thousand, respectively, compared to a constant birth rate of 42 births per thousand. The difference is impressive.

Table 4: POPULATION PROJECTIONS

(thousands and percentages)

Growth Rate					
1980	1990	2000	1970-2000	1995-2000	
Constant fertility	4,651	6,567	9,427	3.4	3.7
High fertility (20% reduction)	4,564	6,194	8,333	3.0	2.9
Medium fertility (33% reduction)	4,540	5,997	7,730	2.7	2.5
Low fertility (50% reduction)	4,505	5,744	6,954	2.4	1.8

Source: CELADE and the Ministry of Planning.

1/ Chenery, Elkington, Simms. A Uniform Analysis of Development Patterns, 1971.

Moreover, almost 70 percent of the difference in total numbers in the year 2000 will be found in children under the age of 10 which will raise the dependency burden and the demand for basic services in health, education, and nutrition. The magnitude of the fertility decline thus assumes a crucial significance for policy-making even though none of these projections produces a "stationary" population in the year 2000. El Salvador should certainly aim for the lowest fertility goal. As a result, in 2000, more than 100,000 births fewer a year will occur. The Government goal of 29 percent contraceptive prevalence by 1982 implies a crude birth rate of 35 per thousand, equivalent to the medium fertility variant. Thus the family planning momentum

and the developmental changes which contribute to fertility reduction must continue to be promoted.

42. While a Special Report on the population issue is being published by the World Bank, the following paragraphs summarize its findings on the recent trends and future impact of variables and programs that will affect El Salvador's demographic future.

Dependency Burden

43. High birth rates and increasingly lower death rates have led to a progressively younger and more dependent population. The proportion of persons of working age has decreased from 55 percent in 1950 to 51 percent in 1975 and the dependency ratio increased from .81 to .97. Particularly striking are the differences between the urban dependency ratio (.84 in 1971) and the rural ratio (1.12). As a result of the reported changes in fertility the age dependency ratio 1/ has begun a declining trend from its 1970 peak (.98), and is expected to return at least to about the 1950 level (.82) by 2000 (under the 33 percent reduction in fertility). If a larger reduction of fertility is accomplished, the decline in the young dependent population which consumes but does not produce, could be much more significant. A 50 percent reduction in fertility would decrease the dependency ratio to .68 by 2000. Lower dependency ratios could provide a better opportunity for increasing savings and thus larger total investment, leading to faster GDP growth and capital deepening.

Nutrition

44. Recent studies ranked El Salvador among those countries most seriously affected by malnutrition. About 74 percent of the population under five shows signs of protein and calorie malnutrition; 22 percent have severe malnutrition (second and third degrees) 2/. In addition, national averages conceal

the rural situation, which is worse than in the urban areas. The bulk of the undernourished are in the rural areas, among the rural poor migrating to the urban areas, and children. Raising nutritional conditions for these groups is a primary concern of the basic needs approach in El Salvador. For this purpose the 1978-82 Development Plan emphasizes increasing the availability of food for internal consumption; commercialization of basic foods; food and nutrition education; health programs affecting food and nutrition; and direct feeding programs. The average targets for 1982 are 2260 calories and 53 grams of protein per day,

1/ Population under 15 and 65 and over to those of age 15 through 64.

2/ INCAP, Clasificacion Funcional de Problemas Nutricionales de El Salvador, Mimeograph Version, 1977.

which represent 95 percent and 88 percent respectively of the estimated average minimum daily requirements. Additional efforts would be required in the 1980s and 1990s to raise calorie and protein nutritional averages to the minimum standards. This effort would would be closely related to the increase of domestic food production.

45. The future demand for food would be determined by population growth, per capita income increases, and income elasticities for food of different income groups. Assuming GDP maintains its long-term growth rate, increasing average per capita income would raise the calorie averages of the population to the minimum daily requirement in 8 to 15 years. The larger the fertility decline, the lower the time span to reach the minimum standards. The Govern-

ment's 1982 calorie targets, if fulfilled, would need an additional 3 to 5 years to comply with average minimum daily requirements. However, some low income groups would still remain below the average.

46. By 2000, food demand would increase 2.2 to 2.5 times from the present level under the four fertility assumptions. Doubling food production means a significant increase in yields per hectare or in the cultivated areas. In the crop year 1976-77, food crops used over 500,000 hectares (about 40 percent of the country's arable land). The land-use implications of population growth are clear. Given the limited availability of arable land, yields have to be increased substantially and land-use carefully screened. Some alternatives are shifting cotton land to production of food crops or raising other export crops that generate larger foreign exchange earnings to pay for increasing food imports.

Environmental Sanitation

47. Better environmental sanitation is a key factor in improving the population's health. A PAHO study has demonstrated that infant mortality is highly correlated with the lack of piped water supplies. Major efforts will be required to provide adequate and safe water supplies, control waste disposal and improve food sanitation in both rural and urban areas. Water supply is a serious problem because of serious agricultural and industrial pollution of surface waters. As a result the National Administration for Water Supply and Sewerage (ANDA), which is in charge of supplying the urban areas, has been forced to draw exclusively from groundwater sources. By 1990, groundwater supplies will be insufficient to meet the needs of the SSMA and surface water from the Lempa River will have to be used for this purpose. Surface waters are polluted with agricultural and industrial wastes, including

pesticides and heavy metals. This makes cleaning up the polluted rivers an urgent necessity. Because of these reasons, the future economic costs of providing potable water in El Salvador will be higher. However, there are financial reasons as well for raising water tariffs. Although ANDA has plans to significantly expand urban water supply, it lacks financial resources due to low tariffs. An analysis of ANDA's targets for 198Z shows that SSMA targets would be met, but the targets for other urban areas would be inadequately covered by the foreseen implementation of water projects.

48. The I4inistry of Health has responsibility for providing rural water supplies; it confronts significant problems in providing safe water to widely dispersed communities. About 30 percent of rural communities (300 to 2000

people) have access to safe water through house connections or public standpipes. In the 1978-82 Development Plan, the Ministry of Health plans to secure safe water for about 60 percent of the rural population by 1982, mostly in the form of public standpipes. This goal is attainable, with an allocation of about V125 to V175 million (US$50 to US$70 million) but only 037.5 million (US$15 million) has been provided in the plan. Further and longer efforts would be needed in the 1980s and beyond to secure access to safe water to a higher percentage of the rural population.

49. Sewerage and pollutant disposal arrangements are inadequate. About 39 percent of the urban population are served directly by water-borne sewerage systems and 48 percent by septic tanks or latrines. In the rural

areas where the service is provided mostly by latrines, only 19 percent of the population has access to sewer systems. 1/ Only 4 percent of the municipalities have adequate water-borne disposal systems. There is no adequate system in the country for treatment of water wastes. Rural latrinization is a critical element of a health program to reduce transmission of diseases among rural dwellers. Currently, however, the rural latrine budget is only eO.5 million per year. Industrial and agricultural pollutants in water sources are also a significant problem which threatens aquatic life, particularly shrimp. The 1978-82 Development Plan considers reducing water pollution by tightening laws and regulations on urban water disposal on rivers and lakes and by expanding sewerage facilities. However, the efforts under way appear to be inadequate to solve present and future water pollution problems, which will become larger with population growth.

Health Services

50. Health services are mainly provided by the Ministry of Health (MOH) and the Salvadorian Social Security Institute (ISSS). The Ministry of Health is the major source of health services for the greater part of the population, since the ISSS covered only 7.4 percent of the population in 1978, excluding the poorer groups. Table 1.8 summarizes the main health indicators of the services supplied by the Ministry of Health. The SSMA with 16 percent of the country's population has 36 percent of the hospitals, about 50 percent of the hospital beds, 41 percent of the medical personnel, and 42 percent of the physicians. The relative dispersion of the rural population, the attractiveness of towns for medical personnel, and the high costs associated with building large facilities help explain those results. The strength of these factors, however, suggests that, to improve rural health care, additional secondary

facilities and para-professional personnel are needed for the rural areas. The Development Plan 1978-82 correctly puts emphasis on the training of a large number of rural health aides. Approximately 1000 aides are expected to be working by 1980. More will be needed in the 1980s and 1990s to take care of the increased rural population.

51. The health programs in the 1978-82 Development Plan include the construction of and equipping of four new hospitals in urban areas and a health centers system with IDB support. In spite of this effort, the health situation would still need continued attention, particularly in

1/ Ministry of Planning, Resultada sobe la Vinenda, Enmerta de Hogares, Abril-Julio, 1975.

rural areas. Past deficiencies and rapid population growth will put pressure on existing facilities at the end of the program. In the long run, the magnitude of the population pressures on health facilities would be affected significantly by fertility trends and the resulting population by 2000, which may differ by 20 percent to 60 percent of the 1978 population under four fertility assumptions. The implications for increasin, budgetary allocations for health services are very significant. These allocations have grown from 1.5 percent of GDP in 1970 to 1.8 percent in 1977 but are still insufficient to cover present needs. Even in 1977-78 budget pressures have limited the Government's ability to staff already-constructed hospitals, and low wages have not attracted or retained trained staff. In addition,

trained health personnel is scarce.

Basic Education and Training

52. Education expansion is also an urgent need, particularly in the rural areas. In 1971, 55 percent of the rural population over age 10 was illiterate as compared to 20 percent of the urban population. While in recent years, considerable progress in schooling has been achieved, the gross national participation rates are only 75 percent for primary education, and 20 percent for secondary education 1/, extremely low by regional standards. Despite its dominant share of the country's children, the rural sector has much lower and decreasing shares of the enrollment along the education ladder, mostly as a result of inadequate provision of schools and teachers, particularly at the higher grades. Only 30 percent of rural primary schools offered fifth grade or higher grades compared to 90 percent of urban schools. In addition, teacher/ student ratios are strikingly different; in 1976, there were 60 students per teacher in rural schools compared to 40 in urban areas. Significant discrepancies also exist between the 14 departments with regard to access to the cycles of education with those in the SSMA showing the highest levels. The Northern Zone departments of Morazan and Cabanas have the lowest education access rates.

53. Female schooling in the first and second cycles of primary education is not significantly lower than male in both urban and rural areas. The urban-rural comparison, however, needs qualification; total rural enrollment, where 60 percent of the country's children live, is only about 44 percent of total enrollment. Female enrollment in the third cycle of primary and in secondary schools, however, declines sharply in rural areas. Given the evidence on the correlates of fertility, the exclusion of women from rural

schools would continue to be reflected in much higher rural fertility.

54. The Second Education Development Plan (1973-77) launched some new programs to improve the quality and efficiency of the formal education system and meet some of the manpower needs of the productive sectors. The main results have been diversification of the secondary education's curricula; introduction of practical subjects in basic education; construction of new rural schools and more efficient utilization of existing schools. However,

1/ Primary education consists of nine years equally divided in three cycles. Secondary education (grades 10-12) permits specialization in academic subjects commerce, administration, teaching, industrial and vocational arts, etc.

much remains to be done. Graduates of the diversified secondary program have not reached the number or training levels programmed in the Educational Plan; repetition and drop-out rates in primary schools are high; educational television has been less effective than expected; rural school construction is proceeding behind schedule; and revised curricula are not yet reflected in textbooks and educational materials.

55. The Education Plan 1978-82 will strengthen the quality of the formal education system at the basic and secondary levels with external assistance. The expansion of basic education would include the construction of 3,500 additional classrooms in rural areas, and the replacement of urban schools. Although the Government programs increased investment in the

educational system, the resources committed and the changes introduced would not be sufficient to provide primary education to all primary school-age children by 1982. Further outlays would be required with future educational expenditures after 1982 determined by demographic trends of school-age children and by the need to increase their participation ratios (in 1975, 50 percent of the total school-age population was attending school). A declining fertility would again make a striking difference in the educational outlays needed. Under unchanging fertility, for instance, the school-age population will by 2 million by 2000; if a 50 percent reduction in fertility is experienced the school age.population will be 1.5 million or about 25 percent less.

56. The Government is also making an effort to improve industrial and agricultural training programs, which until recently have been inadequate to cope with the manpower needs of the economy. The few training programs for industrial and artisan occupations lacked adequate financing, personnel and physical facilities, and the extension programs of the Ministry of Agriculture had little emphasis on the training of small-scale farmers and agricultural workers. The new vocational training program would include three industrial training centers and ten mobile training units; facilities for training management personnel and small- and medium-scale entrepreneurs; and nine new agricultural training centers. All industrial training would be placed under a specialized agency to be created while the National System of Agricultural Training (CENCAP) would coordinate and implement rural non-formal training and diffuse modern technology to farmers. CENCAP would operate a network of nine new rural training centers for motivated farm and community leaders. The industrial program would cover about a third of the new workers needed by

industry in the next few years. Agricultural training would be provided to 9,600 to 12,000 people in the rural areas with particular emphasis on intensive land utilization and cultivation of basic grains using CENTA's new technology; nutrition and health; family planning; and home improvement. In addition, every year almost 4,000 rural and urban poor will receive basic occupational skills training.

HousinR

57. Housing is another problem. Roughly 53 percent of all the population was without public water in 1975, 61 percent lacked sanitary facilities, and 86 percent of the rural population was without access to electricity. 1/ To improve living conditions in the urban areas, the Government has provided

1/ Ministry of Planning, op. cit.

13,062 housing units for lower- and medium-income households during 1973-75, through the existing Government housing agencies. A private organization, Fundacion Salvadorena de Desarrollo y Vivenda Minima (FSDVM in the last few years has also become a major provider of low-cost housing and community development. While the 1978-82 Development Plan has a construction housing target of 67,0W urban units and 20,000 new rural units, only 30,000 new urban housing units may be completed in the next few years. An additional 10,000 of the lowest-income families would also receive housing credit or serviced sites. These efforts, however, are insufficient; one estimate is that 77,000 new housing units would be needed in urban areas by 1982 and 84,000 in the rural areas.

58. Housing for marginal urban families is expected to be an increasing need as rural-urban migration accelerates. The growth rate of the marginal population in the SSMA is now estimated at 5.8 percent a year. An EDURES study estimates that by 1987 there could be 131,000 marginal urban families. This number would increase further in the 1990s if measures are not taken over the next few years to improve living conditions.

Income Distribution and Population Growth

59. The Salvadorian income distribution showed some improvement between 1965 and 1977 with the lower- and middle-income groups increasing somewhat their relative shares. This occurred in spite of significant population growth, which increased the dependency burden, restrained the growth of real wages, and contributed to underemployment and unemployment. Most of the redistribution appears to have taken place at the lowest 40 percent of individuals.

Table 5: INDIVIDUAL INCOME DISTRIBUTION IN EL SALVADOR

Percent of Income			Cumulative Percent of Total Income Received	
Percentile	1965-67	1977 Change	1965-67	1977
0-10	1.1	1.6 +0.5	1.1	1.6
10-20	2.1	2.7 +0.6	3.2	4.3
20-30	3.0	3.3 +0.3	6.2	7.6
30-40	3.9	4.4 +0.5	10.1	12.0
40-50	5.1,	5.5 +0.4	15.2	17.5
50-60	6.6	6.7 +0.1	21.8	24.2
60-70	8.5	8.3 -0.2	30.3	32.5
70-80	11.6	11.6 -	41.9	44.1
80-90	16.8	16.9 +0.1	58.7	61.0

90-100	41.3	39.0	-2.3	100.0	100.0
Gini coefficient				.5389	.4998

Source: World Bank, Shail jain, Size Distribution of Income, A Compilation of Data, 1975. MINPLAN, Muestra de Hogares, August 1976 - July 1977.

60. A complete analysis of the income distribution data does not exist and thus only partial explanations of the recent results may be advanced. First, the structure of production shifted toward industrial production. Second, agricultural production increased at a higher rate than the rural labor force, raising the average productivity of farm workers. The shift of workers out of agriculture also narrowed income differentials. Third, as the productive structure changed, higher urban incomes (particularly in the SSMA) attracted increasing number of rural migrants. Fourth, minimum wage legislation for farm labor was significantly strengthened in 1965 and the following years.

61. Although the lowest income groups may have improved somewhat their share of GDP, poverty is widespread in El Salvador. About one-fifth of the urban population is below estimated absolute and relative poverty levels, while about one-third of the rural population is below the estimated absolute poverty threshold and one-eighth below the relative poverty level. This large difference in rural poverty levels is explained by the lower average living conditions and incomes prevalent in rural areas.

Table 6: POVERTY LEVELS /a, 1977

(in US Dollars per year)

	Urban Poverty	Rural Poverty
Absolute level	260	185
Population below	20%	33%
Relative level	281	110
Population below	22%	13%

/a The absolute poverty level is defined as that income level below which a minimal nutritionally adequate diet plus essential non-food items are not affordable.

The relative poverty level is defined as one-third of the estimated per capita personal income.

Mission estimates,

V. POPULATION GROWTH AND EMPLOYMENT

A. Labor Absorption by Sectors

Overall Trends

62. During 1961-71, the economically active population and the labor force increased annually at rates of 3.7 percent and 3.0 percent respectively. The growth of population coupled with the limited agricultural frontier and the return of Salvadorian migrants from Honduras taxed the employment-creation

capacity of the economy, particularly in the non-agricultural sectors. While agricultural employment increased by 2.6 percent a year, non-agricultural employment increased by 3.6 percent a year, with significant labor absorption in the informal sector. National open unemployment, however, rose from 5.1 percent in 1961 to 11.8 percent in 1971 as the industrial sector slowed down as a result of the loss of the Honduran market, related trade difficulties with Nicaragua and Costa Rica, and the return of Salvadorian migrants. As the economy recovered in the mid-1970s and manufactured exports showed more dynamism, employment rapidly expanded in manufacturing, construction, and related services, reducing total open unemployment to about 5.2 percent in 1975. 1/

Agriculture

63. Agriculture is the most important sector in the economy with about one-fourth of GDP and one-half of the employed population. Pressure on productive land is high with about 2-3 hectares of land per agricultural worker. Agricultural production has a dualistic pattern, which shapes the country's economy. Export crops are produced mainly in about 2000 farms (each larger than 100 hectares) with about 40 percent of the arable land, while basic grains are mainly produced in about 250,000 farms (mostly below 10 hectares) with about one-fourth of the arable land. In addition, about 64 percent of the producers of basic grains are renters or sharecroppers. Agricultural employment is estimated at over 600 thousand people. About 450-500 thousand are permanently employed in agriculture (over 100 thousand are relatives working without remuneration) and the remainder are migratory workers hired mostly for the harvest season. Labor absorption of permanent workers took place at only 2.1 percent a year during 1961-71, implying a more rapid

increase in temporary workers over the period.

64. Most export crops (coffee, cotton, sugar) provide only seasonal employment. With two crops a year, basic grains provide somewhat more stable employment during the year. The peak labor demand occurs during November-January and there is evidence of urban dwellers moving to the countryside for crop harvesting. 1/ Employment and labor force participation decreases during

1/ Ministry of Planning, Employment and Demographic Survey, 1975.

2/ A PREALC-CONAPLAN survey found that about 2 percent of the labor force in San Salvador was employed in crop harvesting.

May-August and continues to decline to the lowest levels in September-October. Seasonal unemployment is lowest and structural is highest among farmers with less than one hectare since they depend more on off-farm employment. Seasonal unemployment increases with farm size until at the 10-20 hectare size, all unemployment is basically seasonal. 1/

65. Although large farms in export crops have larger seasonal fluctuations than small farms in basic grains, export crops have been a more significant source of employment creation. In addition, export crops have offered an opportunity to small farmers and landless peasants to raise their subsistence incomes with seasonal work at higher minimum wages than those paid for general agricultural work.

Manufacturing

66. The manufacturing sector accounts for about 19 percent of GDP and

10 percent of the occupied labor force. It is highly concentrated in the SSMA (over 50 percent of manufacturing value-added and employment). Although manufacturing grew at an average 7.2 percent during 1960-77, production and employment fluctuated widely. During 1960-68, manufacturing grew by 10.7 percent a year and employment at over 4 percent a year owing to the creation of the Central American Common Market. During 1968-72, manufacturing growth slowed down to 3.9 percent a year and employment increased at only 2.4 percent a year because of the conflict with Honduras, which resulted in the loss of the Honduran market and transport difficulties with other trading partners in the CACM. During 1973-77, however, manufacturing value-added grew at 5.9 percent a year and employment at 4-5 percent, because of the expansion of domestic and CACM demands and the establishment of some labor intensive export-oriented industries. The elasticity of total manufacturing employment to value-added was about .44 during 1961-71 2/ which is comparable to elasticity values in other developing countries.

67. Factory employment (5 employees or more) increased at a much faster rate than employment in small scale industries, as production and employment in factories producing for the CACM expanded vigorously. Industries receiving benefits under the Central American Agreement on Fiscal Incentives have a significant share in factory value-added and employment (about 50 percent and 44 percent respectively in 1971). Employment in these industries increased rapidly, about 12 percent a year during 1971-75, although their labor/value added ratio was below average. 3/

Fiscales y sus Efectos sobre el Empleo y el Desarrollo del Sector Industrial de El Salvador, (1977).

Other Sectors of the Economy

68. Other sectors of the economy, which account for about 50 percent of GDP and 40 percent of the occupied labor force, comprise modern, high productivity activities together with informal, subsistence activities. Among the modern sectors, growth and employment in power generation, organized commerce, financial services, and transport were closely related to the expansion of agriculture and industry during 1960-77. Construction growth and employment expanded with Government infrastructure programs, particularly since 1973. In addition to cyclical fluctuations, construction employment fluctuates seasonally with the rainy season in the rural areas. These seasonal fluctuations reinforce the peak labor demand during the harvest of export crops. Public employment rose at 5.7 percent a year during 1972-77 as services expanded. The larger increase took place in the autonomous institutions. Expanded public employment brought about a substantial increase in the number of professional and technical posts.

69. The informal service sector has been a residual employer. Average productivity and thus income levels are low. Poverty is widespread among workers in this sector. Employment is highly concentrated within the family. Working hours are long; participation rates in the labor force and open unemployment rates are higher than for workers in the formal sectors.

B. Labor Force Projections and Employment Perspectives

Labor Supply

70. El Salvador's future labor supply will be determined largely by the demographic characteristics of its population. The mission's estimates are based on the national population projections using two of the four fertility assumptions (33 percent and 50 percent declines in fertility) and on estimates of the future age-structure and male-female participation rates in the economically active population. 1/ Lower population growth rates have little impact in decreasing the labor supply in the 1980s and early 1990s. The impact of lower fertility on the size of the labor supply shows more clearly by 2000 with decreases of 9 to 12 percent if fertility declines by 33 percent and 50 percent. The main forces operating behind the labor supply growth are: (i) rapid increase of the male population with very high rates of participation; (ii) rapid expansion of the female labor force with increasingly higher participation rates; (iii) declines in participation rates among the 10-14 and 15-19 age groups (male) as schooling is increased; (iv) higher female participation rates in the cities (31 percent in 1971) than in rural areas (13 percent); and (v) increasingly higher female participation in the labor force in the 15-19, 20-24 and 25-29 age groups.

Employment

71. Employment creation by sectors would depend in the evolution of average sectorial productivity and growth rates, as well as on Government employment policies. The impact of different growth patterns on employment is illustrated in Table 8. Given the expected labor supply, industry would have to play a leading role in labor-absorption over and above historical trends. Maintaining the historical industrial employment trend (Alternative I)

would require a very significant retention of laborers in agriculture and substantial pressures on employment in services, in particular the urban informal sector. Increasing manufacturing employment significantly would also have a multiplier effect on employment in modern and higher productivity services, alleviating some of the employment pressures on the informal and agricultural sectors (Alternative IV). Increasing manufacturing employment and developing agricultural production through more intensive utilization of the land (Alternatives II and III) would result on higher labor absorption in the productive sectors and significantly lower pressures on the urban informal sector. From these illustrative projections, the policy options are clear.

72. Manufacturing has to grow faster (at least 7 percent a year", recovering its earlier dynamism mostly on the basis of exports of labor-intensive manufactures to third countries. Industrial labor-absorption would depend on

1/ Male participation rates were high in the 1971 Census and have been used for projecting the male labor force with the exception of the 15-19 year-group where the 1961-71 declining trend has been used. Female participation rates have been increased accordingly with earlier trends implicit in the 1961 and 1971 censuses.

the employment-value added elasticity, which is higher in factories than in handicraft and artisans (.56 against .29). 1/ Among factories (5 employees or more), the larger factories also showed a higher employment value added elasticity. Thus, developing labor-intensive manufactures and promoting factory production would result in higher employment per additional unit of value-added. In addition, power, transport, and formal service sectors would have to follow the dynamic trend of manufacturing. Construction also must continue to be dynamic based on growing public and private investment, of which housing would be a significant component. Given the labor-intensive nature of housing construction, this emphasis would substantially increase employment.

73. Agriculture must grow at 3 to 4 percent a year. Although declining in relative terms, agricultural labor-absorption would still have to be large (at about 2.5 percent a year). Given the high rural labor supply and the limited availability of arable land, efficient exploitation of the land is essential to increase agricultural employment. In this regard, the Government would have to emphasize programs for rural development through credit for small farmers; more intensive cultivation of the existing arable areas; the creation of new agricultural entrepreneurs by land redistribution; switching agricultural production to higher value crops; increasing coffee production, fruits, and vegetables in small farms; irrigation projects, particularly the ones in the coastal areas; and expanded extension and marketing services. The alternative would be higher rural migration to the cities, increased absorption by the low-income informal sector, and higher open unemployment

levels with increasing social tension.

C. Policies to Increase Labor Absorption

74. To provide job opportunities for the new entrants to the labor force all possible sources of employment creation would need to be pursued. The next few sections examine policies to increase labor-absorption in industry and agriculture.

Industry

Labor Intensive Industrial Exports

75. During the 1960's and early 1970's industrial policy aimed mainly at increasing exports within the CACM, in effect for regional import substitution. A competition of incentives developed among the member countries to attract domestic and foreign investors, which led to the Central American Agreement on Fiscal Incentives ratified in 1969 and its regulations (REIFALDI) approved in 1971. In 1974, however, as exports to the CACM slowed down, the Salvadorian Government enacted an export promotion law to encourage exports outside the CACM through fiscal incentives, free zones, and other support measures. 2/ In recent years, a number of foreign firms have been attracted by the incentive legislation and cheap Salvadorian labor. Industrial wages in El Salvador have been somewhat lower than in Korea, Mexico and Hong Kong, but higher than the Philippines (see Tables 8.2 and 8.3). Taking into acecount transport costs and other factors, present Salvadorian industrial

1/ From the 1961 and 1971 Censuses adjusted for comparability.

2/ The new law expanded the incentives of the 1970 Export Development Law.

represent an attractive investment opportunity for foreign firms and, if political uncertainties are satisfactorily resolved, the expansion of labor-intensive industries may result in a shortage of semi-skilled labor in the next few years. The Government has been expanding non-formal education to cope with this possibility (para. 56).

76. In spite of the incentives, manufactured exports to third countries have not grown much. These exports increased from US$18 million in 1971 to US$33 million in 1977. By 1977, these exports represented only 13.8 percent of total industrial exports. The main export items in 1977 were food products (28 percent of exports to third countries), textiles (43.2 percent), metallic products, machinery and equipment (7.9 percent), and chemicals (16.5 percent). (See Table 8.8). During 1971-77, the most dynamic products were: textiles with a 36 percent annual growth rate and metallic products, machinery and equipment with 13.8 percent, mainly due to electric and electronic equipment. Chemical products showed large increases in fertilizer exports in 1975 and 1976 followed by a large decline in 1977; pharmaceutical products exports doubled during 1974-77.

77. About 10 to 15 firms a year have been granted the benefits of the Export Promotion Laws with expected new annual employment at 1,600 to 3,000 workers. Similar figures for firms granted benefits under the Central American Agreement on Fiscal Incentives show that employment creation, if the Export Promotion Law's projects are implemented, would be significant.

78. Altough Government programs for industrial development correctly put emphasis on fiscal incentives and credit availabilities, infrastructure support (free zones, industrial parks, and port facilities), technical assistance, labor training, and other measures to support industrial growth toward markets outside the CACM, the pace of these programs may be too slow to obtain significant results in the medium run. Moreover, the present CACM

incentives system biases the direction of export trade toward the CACM, where, in addition, markets are well known and quality controls are relaxed. Thus Salvadorian industrialists look to the Common Market as the main outlet for their industrial exports. There is need, however, to switch attention to third markets where growth potential (and therefore domestic employment) is higher than that offered by the CACM. In this regard, much could be gained by a more active policy to attract foreign investment participation and to stimulate domestic entrepreneurs. A revision of Central American incentives or the Common External Tariff may help to shift the focus of manufacturing activities to markets in third countries. In the final analysis, however, these efforts may prove inadequate unless the political climate is stabilized.

Agroindustries

79. Agroindustries are a potential source of indirect employment creation. Although agroindustries themselves offer limited employment, they can, however, increase rural employment and incomes, and encourage moves to higher value crops. Direct employment per unit of value-added in agroindustries is higher in food processing, clothing, wood products, and furniture in El Salvador. Among food processing industries, sugar (panela), bakery products, and fruits and vegetables have the highest employment/value-added ratios. Labor intensity decreases as scale increases, particularly for food processing. Agroindustries will increase the demand for farm products, particularly food, textiles and coffee. The impact on small farm income and employment would depend on the raw material intensity of the process and the share in the supply of the raw material. Industries with significant potential impact on small farmers are: milk, fruits and vegetables, tobacco and sugar (panela). 1/ Agroindustries, however, face particular difficulties in

ensuring a steady supply of raw materials and require special efforts from the manufacturer or agricultural producers' association to organize the farmers' production stream. Small cottage industries offer another possibility for increasing employment on the small farms. Among the most feasible are honey, cheese processing, coffee processing, panela, some food processing, and clothing.

Agriculture

80. Prospects for agricultural employment would depend on the expansion of land under cultivation and more intensive utilization of the existing cultivated land. Although arable land is scarce in El Salvador, the IDB/AID/IBRD

1/ Daines, Samuel, Analysis of Small Farmers and Rural Poverty in El Salvador, Annex Agroindustrial Profile, Agency for International Development.

agricultural study found about 150,000 hectares of additional arable land and 500,000 hectares of now unproductive land that may be suitable mostly for forestry. With regard to raising agricultural employment, productivity, and output from lands presently under cultivation, technological changes would play a significant role, particularly in shaping future labor absorption in agriculture. In the recent past, technological changes in Salvadorian agriculture have been mostly labor using (improved seeds, fertilizers, multiple cropping, etc.). This trend must be continued in order to expand significantly employment opportunities.

81. Future labor absorption in agriculture would follow the dualistic pattern of production. On one hand, the backwardness of the small farmers makes them a target group for raising employment and incomes by utilizing labor-using inputs and by switching to higher value-added and employment-generation crops (permanent and garden crops produce approximately five times as much net income per hectare cropped than the other crops). The main obstacles here are the small size of the farms; the lack of capital and know-how; and the longer production period for some crops (coffee, fruits). Increasing production of export crops could be a significant source of additional agricultural employment in the next two decades. Export crops have higher labor requirements per hectare (see Table 10). Given projected external demands for basic export products and long-term trends of domestic production, this development may increase the seasonality of agricultural employment but it may also increase the peasant's incomes. (In 1977, minimum wages in coffee harvesting were 09.25 a day; cotton 06.00; sugarcane 05.50; and in general agriculture 03.75).

82. While agricultural policy during the 1960s was mainly concerned with incentives for export promotion, recently, agricultural policy has been mostly concerned with bettering land distribution, improving incomes of small landholders, and increasing the domestic supply of staple foods by raising agricultural productivity and output. To implement these policies, the previous administration undertook some agrarian reform projects, irrigation, farm credit, production and marketing of basic grains, and research and extension services. The present administration is continuing these programs but decided to shift its emphasis to small irrigation schemes and a large program to raise living conditions in the Northern Zone (Departments of Chalatenango, Cabanas, San Miguel, Morazan and La Union) this zone has 40 percent of the country's land area and a large proportion of very small farm units. The concentration in rural development in the Northern Zone needs to be carefully evaluated against a more intensive development of coastal lands through irrigation and other investments, and land reform. If this proves unfeasible, a strategy of urbanization and attraction of migrants from this zone to urban areas may be another alternative in the long run.

83. As a major step in its rural development plan, the Government in May 1975 secured passage in Congress of the first comprehensive land

reform law. The law provided a legal framework for land expropriation (with deferred payments) for redistribution to small farmers in projects developed by a new Institute of Agrarian Transformation (ISTA). Efforts to implement a significant land reform project in 1976, however, failed because of strong resistance from large land owners and the Agrarian Reform Law was therefore modified, to limit ISTA's expropriation rights to properties that are not exploited in accordance with the following criteria: efficient use of land; protection of natural resources; compliance with labor laws; and active management of the exploitations. The new administration which took power in July 1977, has, therefore, embarked on a new approach to improve the land tenure system. First, it secured elimination of the requirement that the land to be redistributed be limited to ISTA's specific project areas. The land reform institute can now purchase (at ongoing prices and in cash) and redistribute land anywhere in the countryside that is not exploited in accordance with the above criteria. Second, the new administration enacted a 1 percent rural property tax on properties valued at more than V200,000 and, third, a new Corporacion Financiera de Tierras Agricolas (COFINTA), which will acquire and redistribute land to new agricultural producers. In spite of these changes, it will still be more difficult to redistribute land than it would have been under the 1975 law.

84. Estimated acreage now under irrigation only reaches about 35,000 ha of a potential 323,000 ha, including 94,000 ha for minor irrigation (100 to 1,000 ha) to benefit small farms. The 1970 Irrigation Law introduced strict controls of land use and farm size in Government irrigation projects. Under the law, two irrigation projects have been established (Zapotitan with 4,000 ha, and Atiocoyo with 3,400 ha). The Direccion General de Riego y Drenaje

(DGRD) has analyzed four large scale projects (Rio Paz - Rosario 5,600 ha, Sonsonate - Banderas 6,700 ha, Bajo Lempa 41,000 ha, and San Miguel - Usulutan 27,000 ha) in the coastal plains, and ten small projects for a total of 6,000

ha in other parts of the country. The irrigation projects represent a clearly identified possibility of increasing agricultural production, which is now substantially affected by usually long dry seasons (about 6 months). Implementing a large irrigation program, however, is linked to basic changes in land tenure, since the four larger projects are located in areas where land is highly concL-atrated. The investment program 1978-82 includes the San Miguel-Usulutan and Ahuachapan irrigation projects with construction starting in 1981. If executed timely, these projects could help to increase agricultural production and employment in the coastal areas.

85. Consequently, the two main policy instruments now available to the Government for dealing with small farmers are the credit activities of the Agricultural Development Bank (BFA), and the basic grains marketing activities of the Regulatory Supply Institute (IRA). Credit to small farmers expanded significantly since the establishment of BFA; its Banking Division grants loans to commercial farmers (total assets above □100,000) for export crops while its Economic and Social Division provides short-term credit for basic grains, including subsistence non-cash credits (seeds, fertilizers, and pesticides), to very small farms (about 1.7 ha). To improve the productivity and employment incomes of small farmers, however, much remains to be done.

New, expanded BFA credit programs especially designed which include technical assistance, the adoption of better production techniques (preparation of the land, plant density, high yield seeds, and fertilizers), the introduction of new crops in suitable areas; and improved management practices could double yields of corn, sorghum, and beans according to a recent FAO/IBRD mission. 1/

86. The BFA subsistence credit program is assisted by the FAO/World Food Program. Its aims are to increase the productivity and earnings of small farmers, to improve dietary habits, and to coordinate Government agencies supplying services to small farmers. With regard to employment, the results indicate that the modernization of farming methods led to some increase in employment, but that land tenure and organizational problems limited the generation of productive employment. Moreover, continued (and even expanded) production of basic grains in many hilly areas has led to soil depletion and occasional irreversible erosion.

87. IRA, the Government marketing agency, offers minimum guaranteed prices to small farmers. Although IRA support prices are higher than the market prices for basic grains, it has purchased only about 5 percent of the production of basic grains. This proportion is expected to increase in the next few years as small farmers improve their marketing and IRA expands its storage capacity. Strict quality controls are applied by IRA and a significant part of the crops are rejected on grounds of high percentages of humidity. Maize dryers are needed to solve this problem.

88. The National Center of Agricultural Technology (CENTA) has been in charge of research and extension services since 1972. Extension activities are geared toward basic grains, vegetables, cotton, and sugar cane. The

1/ FAO-IBRD/CP El Salvador: Agricultural Credit Projects, Identification

Mission.

present level of services is inadequate (a ratio of 1,150 farms to 1 extension worker). As a result, only about 20 percent of the farms are now covered by extension workers. A significant expansion of extension services is now needed, together with increased decentralization of those services to areas at present not covered.

VI. DEVELOPMENT PROGRAMS AND GROWTH PROSPECTS, 1979-82

Development Strategy and Main Issues

89. The Government's strategy in the 1978-82 Development Plan is to expand the country's productive capacity and create employment by supporting industrial and agricultural growth with large investments in infrastructure, expanded credit availabilities, and an increased supply of trained manpower. At the same time, the Government seeks to improve social standards (health, nutrition, education) and in particular to raise living conditions, production and productivity in the Northern Zone. Population growth also will receive increased attention.

90. El Salvador's ability to achieve its medium term development objectives will be closely related, in addition to coffee prospects, to the Government's success in resolving the following closely interrelated issues:

ti) restoring the private investment climate;

(ii) accelerating manufacturing growth, particularly in labor intensive manufactures for export to third-market countries,

as a source of employment and foreign exchange;

(iii) stepping up rural development efforts in order to improve living conditions of the peasants and meet the domestic demand for food and raw materials;

(iv) generating adequate public savings to cover the local counterpart funds needed by the investment program while coffee-tax revenues slow down; and

(v) analyzing thoroughly public investment projects and their relative priorities, and having clearly defined projects to meet chosen targets.

The most serious issues are the need to restore the private investment climate, which has been weakened by political unrest and the need to promote industrial exports, particularly outside the CACM. Both issues are very closely interrelated. In the longer run, of course, population growth at over 3 percent represents El Salvador's most fundamental problem.

A. Economic Growth Prospects

91. The medium-term economic outlook is closely related to export growth, basically that of coffee and manufactured exports. Coffee exports would depend, on one hand, on coffee prices, which have declined significantly in recent months and are expected to continue declining, decreasing the country's capacity to import, save and invest in the next few years. On the other hand, coffee production is expected to increase from the low 1977-78

level to a higher plateau. As production expands, volumes exported would increase although showing some yearly fluctuations (see Table 3.8). Manufactured exports will depend significantly in the prospects of the CACM, the effective promotion of labor-intensive manufactured exports to third market countries, and (most importantly) on private investment, which would be determined by existing uncertainties about the investment climate. If these uncertainties are resolved, private investment and industrial exports could make a more significant contribution to the economy's growth rate than projected in this report (private investment is projected to grow at only 4 percent a year).

92. Because of the uncertain prospects for private investment, public investment is expected to have a greater role in the performance of the economy during 1979-82. As public fixed investment grows, the public sector's share of total fixed investment would increase from 32 percent in 1978 to about 40 percent in 1982. On the basis of exports and public investment growth prospects, real GDP is expected to increase at only 4.5 percent a year during 1979-82. As a result, per capita income would improve at only 1.5 percent a year. Higher growth rates would need a much faster growth of exports, particularly manufactured exports, or larger coffee earnings to maintain the current account deficit of the balance of payments at manageable levels.

93. Even at this low growth rate, further restrictions on import demand may be needed, because of the industrial sector's demand for intermediate and capital goods; the rising level of public investment; and the high elasticity of imports to GDP in the last two years (particularly in 1977), when import restrictions were substantially liberalized. Therefore, special efforts would

be needed to slow down import growth through tighter credit policies, import restrictions, and tax measures.

B. The Public Investment Program

94. The public investment program supports the Plan's strategy for the productive sectors with significant investments in infrastructure and larger credit availabilities for agriculture and industry. It also supports the Plan's social policy with investments in housing, education, health, water and sewerage. The public investment program totals about V6.3 billion in 1978-82, of which about 71 percent represents fixed investments. Of these, infrastructure represents 42 percent, mainly for power and transport; social investments 31 percent, mainly for health, education, water and sewerage;

and the productive sectors and public administration, the remainder. (See Table 5.20). This sectorial distribution reflects the mission's estimates taking into account the state of preparation of projects and arrangements for their financing and execution. The percentage distribution represents a change from earlier trends and reflects the Government's policy of increasing social investments. Actual investments, however, may be lower and result in a higher share for infrastructure investments because power, transport and telecommunications are sectors with proven executing capacity, while the agricultural and social sectors are expected to face some difficulties in meeting investment targets because of their weaker executing capacity.

95. There is a need for the Government to move to a much more specific

and focused ordering of development priorities, and the generation of clearly defined programs and projects designed to meet chosen targets. In particular, special efforts will be required to stregthen the executing capacity of the Ministries of Agriculture, Health and Education in order to both carry out their investments and meet some of the important priority goals of the public investment program. The priority of some projects seems questionable; e.g., the feasibilities of the fertilizer and sponge iron plants need to be carefully evaluated. With regard to programs and policies for regional development, planning processes are weak and do not provide the analytical framework for making investment decisions between geographical areas of the country. There is need for a considerable strengthening of systems and procedures for coordinating urban and regional development. Government decisions are needed on an adequate framework for the systematic establishment of priorities for public investments and activities in each area of the country; on effective mechanisms for linking planning and implementation at the national level with priorities at the municipal or local level; 1/ and on spatial population objectives in order to implement consistent regional policies and investments and the related policy issues with regard to the expected expansion of the SSMA and the attempts to modify rural migrant flows and to develop primary regional urban centers in San Miguel and Santa Ana, surrounded by towns of secondary importance.

96. Transport, power, housing and other social investments, agriculture and industry are the priority areas which are receiving the highest public investment allocations during 1978-82. Transport investments are the largest. The main projects are: the San Salvador-San Miguel highway, the San Salvador-Comalapa-Cuscatlan Airport highway, the Comalapa-Zacatecoluca highway; the

Northern highway, the Acajutla container port; and the Cuscatlan Airport. Power investments are also very large, with the San Lorenzo hydro-electric dam, and the third unit of the geothermal plant as the main projects. Social investments include the construction and equipping of the general hospitals

1/ See EDURES Rural and Urban Development Study.

of San Miguel, Sonsonate and Rosales, and the gyne-obstetric hospital; water supply and sewerage in San Salvador and in a large number of small municipalities; housing for low income groups and financial support for private housing construction, particularly workers covered by FSV; and construction of rural schools, training centers, and technological schools. Investments in agriculture and industry include irrigation and drainage in the San Miguel-Usulutan and Ahuachapan areas; small irrigation projects; integrated rural development of Chalatenango and Morazan; a fishing port and terminal; a livestock health development project; industrial parks and free zones; a fertilizer plant; a sponge iron plant; and construction materials and metal-mechanic industries. In addition, substantial public credit programs for agriculture and industry will support the private sector development in these two sectors. A detailed analysis of the investment program by sectors and projects is presented in Annex A. (See also Table 5.20).

C. Prospects of Public Sector Finances

97. Given the large increase in public investment, the Salvadorian Government would need to increase public savings, which will be reduced

significantly by the expected continued decline in coffee prices. As noted in para. 16, the savings of autonomous agencies are determined mainly by the revenues of ISSS and INPEP, which are expected to increase from expanded social security coverage of a growing labor force. The savings of public enterprises are expected to increase from tariff revisions and expanded operations, particularly in CEL, ANDA, ANTEL, and CEPA. (See Table below.)

Table 11: PUBLIC SAVINGS PROJECTIONS

Source: Table 5.18, Statistical Appendix.

98. During 1979-83, the revenue projections of the existing tax system hinge on the export tax revenues from coffee and on the rise of domestic tax

receipts from the expanded economic activities. Coffee receipts may decline by as much as ₡200 million a year. Economic expansion and higher monetary income levels, however, would increase collections from income, import, and domestic transactions taxes. Income tax collections are expected to be dynamic as monetary incomes rise (on the basis of a buoyancy of 1.5 during 1970-77). Revenues from taxes on domestic production and consumption are also expected to rise with the increase in monetary income (buoyancy 1.15), although some are specific excise taxes, so that revenues only go up with production increases. Collections from import taxes are expected to increase as imports grow, even though, during 1970-77, these taxes showed a low buoyancy, largely related to industrial incentives. On these assumptions, total tax collections of the Central Government would increase from 1.2 billion colones in 1977 to 1.9 billion colones in 1983. (See Table 5.17) As a result of the significant decline in coffee revenues, the tax burden would decline to about 15 percent of GDP, in the next few years, still above the traditional 10-12% of the early 1970s. The Government, however, would need additional resources to carry on its investment program. The following possibilities may be considered: (i) increasing tax revenues through tax reforms for which some alternatives are substitution of a sales tax or a value-added tax for the present 1 percent stamp tax; transforming the specific rate excise taxes on liquor, alcohol, soft drinks, and petroleum products into ad-valorem taxes to avoid the deterioration of real revenues by inflation; imposing a new tax on urban property and on exports (cotton); (ii) increasing the utilization of foreign credits since the external debt service is low. The quality of the Government's investment program will be important here, since the better projects could attract larger flows of official, longer term or concessionary

loans.

99. The Central Government is expected to continue its prudent current expenditure policy, which has effectively increased savings in the past, even though the expansion of Government services will need more qualified personnel and increases in operating expenditures. In this regard, wage policy for technical and professional personnel needs revision in order to retain qualified personnel in the public administration.

100. The balance of the needed public savings will be generated mostly by the autonomous enterprises by raising tariffs and prices of public services (mainly for water, electricity, port and telephone services). Strengthening the financial position of public enterprises would diminish the need for current and capital transfers from the Central Government, thereby increasing the financial resources available for other economic and social programs.

D. Balance-of-Payments Prospects and Creditworthiness

101. During 1979-82, declining coffee prices, given the weight of coffee earnings in total exports, coupled with high levels of imports (albeit more slowly growing), due to a rising public investment and a higher domestic demand, are expected to bring about increasing deficits in the current account

of the balance of payments. To reduce these expected deficits, the Government needs to (i) promote exports of new products and tourism and (ii) follow a more restrictive import policy. In spite of these actions, a greater use of external financing than has been the custom in the past would make it possible

to have a larger resource gap in the next few years.

102. During 1979-82, to sustain a growth rate of 4.5 present a year, allow a larger resource gap than in the past (while still maintaining a satisfactory level of international reserves) and finance the public investment program as outlined in this report, El Salvador will require gross official external financing at an annual average of about US$300 million, with net disbursements at an annual average of US$276 million, of which about US$170 million could be from official sources. Under these conditions, the external debt service would increase from 6 percent of exports in 1977 to about 12 percent in 1982.

103. A growth rate of 4.5 percent over the next five years is not a bright prospect for El Salvador. Indeed, it contrasts with the Government's estimate of 6 percent, which reflects its view of what would be necessary to generate substantially more jobs in both rural and urban areas and provide sufficient resources for a more dynamic development program. The fall in coffee prices, expected slow growth in crucial private investment in manufacturing, and the resulting short-term poor prospects for the needed takeoff in manufactured exports to CACM and other markets means that El Salvador will be a foreign exchange constrained economy over the next five years. While the debt service ratio would double as borrowing is accelerated, it should still be quite manageable. El Salvador should do everything possible to accelerate exports beyond the rates projected in this report and increase the share of its public investment program that includes projects suitable for financing by official and concessionary lenders. Nevertheless, it is clear that the country will need as much long term and concessionary finance as can be marshalled. Its limited per capita physical resources, continued rapid

population growth, substantial rural and urban poverty, and problems in overcoming the initial stages of establishing a dynamic series of manufactured exports indicate the need for such support. Its external resource need, the limited import content of many social programs, and fiscal needs indicate that official lending should also be used to supplement local currency costs, especially in support of social programs.

ANNEX A

SECTORAL AND INVESTMENT PROGRAMS

This annex describes the Government's 1978-82 public investment program. The review of its sector suitability and specific project content is in the main text.

A. Power

1. The Comision Ejecutiva Hidroelectrica del Rio Lempa (CEL) is the dominant supplier of public - service electricity in the interconnected national power system; its plants generate about 95 percent of the electricity, the remainder being generated by five of the eight distributing companies and one other small bulk supplier. CEL sells in bulk to the eight distribution companies. It also sells directly to about 20,000 rural customers and a few large industrial customers and government agencies. The largest of the distributors, both in terms of energy sold and customers served, is Compania de Alumbrado Electrico de San Salvador (CAESS), which is 88 percent owned by Canadian International Power of

Montreal and 12 percent by Salvadorian and foreign individuals. The remaining distribution companies are owned by local interest. The quality of CAESS' and CEL's service is good. However, many of the smaller distributors have been unable to install the facilities necessary to serve the public's needs because of shortage of funds. Merger between some of these distribution companies would probably help achieve economies of scale and improved service.

2. All utilities, except for CEL, are subject to regulation by the Inspeccion General de Servicios Electricos (IGSE) of the ministry of Economy. CEL is authorized under its charter to establish its own tariffs subject to approval by the Government. In practice, CEL discusses its tariff proposals with the Ministry of Planning, the Ministry of Economy and with presidential advisors prior to formal approval of tariff revisions. This process has not been unduly cumbersome, allowing CEL to quickly react to adverse developments in its financial positions. While easy to adjust to changes in financial conditions, the present tariff structure does not appear to reflect the long-run incremental cost of supply. Studies are therefore underway to determine the incremental cost of providing service to various groups of customers and to propose an alternative tariff structure which would reflect marginal costs.

3. El Salvador's only known indigenous energy sources of any magnitude are the Lempa river and the geothermal fields, and only about one-third of the total installed generating capacity is based on fuel-fired plants. Dependence on fuel is expected to decrease significantly in future years, as power development focuses on continued exploitation of the Lempa river and geothermal resources. Detailed geophysical off-shore studies are planned

in the near future to determine the possibility of oil deposits. El Salvador has no known coal deposits.

ANNEX A

4. Recently, the Government delegated to CEL the responsibility for national energy planning. CEL has completed, with the assistance of consultants, a study of future hydro development of the Lempa River. Feasibility studies are also underway to determine the geothermal potential in Berlin, Chinameca and San Vicente. Preliminary data indicates that these areas are potentially viable sites for the development of geothermal power generation. Plans are also being drawn up for interconnecting the Salvadorian and Guatemalan systems. Under these plans, Guatemala will purchase energy from El Salvador until 1983, when the Guatemalan Chixoy hydroelectric project is expected to be in operation; the reverse would take place, after 1983, if required.

5. Market studies predict an increase in El Salvador's energy demand of about 11 percent annually during the 1977-1986 period, somewhat higher than the 9.8 percent growth in demand of the 1967-1976 period. Maximum demand on CEL's system will thus grow from 184 MW in 1975 to 531 MW in 1985, while the demand for energy will increase from 929 GWH in 1975 to 2,650 GWH in 1985. In 1976, CEL's installed generating capacity was 283 MW; in 1980, CEL's projected installed capacity will reach 448 MW which will amply meet the demand for power up to the end of 1981. By 1982, when the San Lorenzo hydro-

electric project is expected to be completed, total installed capacity will reach 624 MW, sufficient to meet the projected demand of 531 MW. In addition, geothermal power from the Berlin, Chinameca and San Vicente areas could be developed by 1985 or earlier if required.

6. Total investment during 1978-1982 is expected to reach 0766 million (in current prices) or about 18 percent of total fixed public investment, which is significantly less, as percentage of total investment, than the investment made in the sector during the previous 5-year period (30 percent). Almost two thirds of this investment will be for the 120 MW San Lorenzo hydroelectric dam. Total expected cost of this project is V500 million (US$200 million).

7. Under a rural electrification program begun in 1962, CEL and some of the private utilities have provided access to electricity supply to almost 600,000 people, about 25 percent of the rural population, however, only about 62,500 rural customers are in the system, which is indicative of the low purchasing power of the rural population. CEL's sales in the rural areas have increased at an annual rate of about 27 percent since 1970 and reached 26 GWh in 1975. For 1978 - 1983, CEL plans to invest about 02.5 million (US$1.0 million) annually from its own resources, and Government transfers, in order to continue establishing new rural distribution networks. The rate of expansion of the rural network, however, is expected to decrease from that achieved in the past, as a high percentage of the communities where electrification is economically justified are already being brought into the system.

ANNEX A

B. Transport

Roads

8. Transport investments represented about 30 percent and 23 percent of total public investment in 1968-72 and 1973-77, respectively, reflecting the high priority set by the Government to linking together the country with a basic transportation system. A significant share of transport investments was allocated to road consumers. As a result of the emphasis given to this sector, the road network has been increasing of about 6 percent a year. At present, the country's road system comprises approximately 11,000 km. Of this total, about 6,400 km (58 percent) are all-weather roads, while about 4,600 (42 percent) can be used only in the dry season. The most important are two nearly parallel highways crossing the country longitudinally from east to west: the Pan American Highway, located in the central plateau, and the Coastal Highway running along the coast. Traffic on these highways has increased at about 14 percent a year during the last five years. There are also three principal roads crossing the country from north to south which link the coastal areas with Guatemala to the west and Honduras to the North and East.

9. In the past, priority was given to paving existing roads rather than developing badly needed rural roads. Consequently, many towns and potentially productive agricultural areas lack all-weather farm-to-market raods. Moreover, many of the existing feeder roads are dry-weather tracks which become impassable in the wet season. Even during the dry season, the steep grades and very rough surfaces of the same roads constraint the flow of traffic. In spite of these difficulties, traffic on feeder roads

has also increased at about 14 percent a year in the last five years. The responsibility for rural road maintenance and rehabilitation in the territory of the Municipalities is being transferred from the Ministry of the Interior to the Ministry of Public Works. The procedures and institutional arrangements for implementing the road maintenance and rehabilitation program, however, are still unclear.

10. The Government plans to tackle some of these deficiencies during 1978-1982, particularly in the northern and more mountainous sections of the country, since the development of a feeder road system would be an integral part of its strategic program to develop the production capacity of the northern sections of the country. This program, which would serve an area of about 8,000 km2, would have as its main artery the Northern Highway, a paved secondary road of 314 km. Feeding this main artery are a series of penetration roads which the Government hopes would encourage the production of domestic and export goods in the area; open the area to basic social services; generate employment and new sources of revenue to rural and urban populations.

11. The 1978-1982 investment program includes several projects for the construction of feeder roads, to be carried out in connection with a

country-wide road expansion program. The main priority project is the Northern Highway and its complementary penetration road system, scheduled

to begin during the latter part of the 1978-1982 period. Other projects in the program currently in execution include the San Salvador-Comalapa-Cuscatlan Airport Highway (scheduled for completion in early 1979), the improvement of the San Salvador-San Miguel highway, and several interconnection and by-passes located near main urban areas. In addition, the Government is planning the construction of several passenger terminals, and to introduce intermodal transport (container, roll-on/roll-off equipment), on a much larger scale, including a cargo terminal for SSMA. This would foster growth of the trucking industry, through the modernization of the industry's methods of operation and the regionalization of its operations.

Railroads

12. The rail system of El Salvador covers 752 km of lines connecting the main urban areas to the ports of La Union (Cutucu) and Acajutla. At Cutucu almost all of the traffic is moved by rail. The present system is administered by Ferrocarril Nacional de El Salvador (FENADESAL) managed by the Comision Ejecutiva Portuaria Autonoma (CEPA) on behalf of the Government, which pays the subsidies required. The system operates at a substantially higher costs than road transport because important points are not served by the railways and shipping distances are short. The Government is assessing the economic viability of the railway operations compared to other transport modes and thus, for the 1978-82 plan, the total investment in railroads will cover mainly rehabilitation of existing equipment and acquisition of rolling stock.

Ports

13. El Salvador has three deep-water ports: Acajutla, La Libertad (presently closed to traffic) and La Union (Cutucu), which are under the port

authority (CEPA). Acajutla is by far the principal port of El Salvador with general cargo movements (other than bulk) currently in excess of 500,000 tons per year. A recent analysis indicates that ship waiting times for congestion is approaching the annualized cost of a new general cargo berth. In addition, traffic projections for Acajutla show a steady 6.5 percent average compound rate of growth between 1974 and 1980. Thus, CEPA plans to construct container handling facilities in Acajutla at a cost of about 0125 million (US$50 million), for which feasibility studies are being completed.

14. Given the very short road distances in El Salvador, the adequate road network, and the long-term rather limited possibilities for further expansion of the Acajutla port beyond the proposed container facilities, consideration should be given to a comprehensive plan for the future development of La Union. A fishing port facility near La Union is already included in the investment program 1978-82.

ANNEX A

Air-Transport

15. The small surface area of El Salvador limits air traffic to international services and to local private services by small aircraft. The Ilopango International Airport, constructed during World War II, is located about 8 km east of San Salvador, adjacent to the San Bartolo free trade zone. A new international airport is expected to be completed in early 1979 at Comalapa (Cuscatlan) at an estimated cost of about V135 million (US$54 million).

The airport is expected to play a key role in tourist promotion and in the development of the proposed adjacent free-trade zone.

Telecommunications

16. In 1963, the Government reorganized the telecommunications sector and placed it under the new autonomous agency, the Administracion Nacional de Telecomunicaciones (ANTEL), which is responsible for all telecommunications in the country. ANTEL's major institutional problems have been the lack of continuous planning activities and shortage of technical staff. To solve these problems, ANTEL has retained technical consultants for planning and considerably strengthened its planning organization; recruited additional technical personnel; set up a local training center for low and medium level technicians; and sent several engineers abroad for specialized telecommunications training. In spite of these improvements, ANTEL has yet to develop fully in-house capabilities for planning and expansion of telecommunications facilities, to identify projects for a balanced development, to improve service quality, to set up reliable data collection systems and to improve and refine demand forecasting methods. ANTEL needs also to introduce further improvements in its financial management and accounting proceures.

17. The telephone density (1.39 per 100 persons) in El Salvador, is one of the lowest in Latin America 1/; it is also lower than a number of countries in other parts of the world with similar or lower per capita incomes (e.g., Tunisia--2.03; Zambia--1.45, and Syria--2.14). Existing telephone service is concentrated in the San Salvador Metropolitan Area (SSMA). Telephone density in the SSMA is only 5.40 per 100 people compared to 16.1 in San Jose, Costa Rica, 13.0 in Mexico City, 10.6 in bogota and 8.9 in Santo Domingo. Telephone density for the rest of the country is approximately 0.41 per 100 people.

Of the 201 "cantons" with populations over 2,000, only 9 have access to telephone service and of the remaining 1,821 cantons, only 8 have access to service. Lack of timely investment and proper planning in the past has resulted not only in a large unsatisfied demand for telephone service but also in significant congestion in some exchange areas and some long distance networks. Development of telecommunications in El Salvador has lagged behind the rapidly growing needs of industry and commerce sectors which play an

1/ Telephone density in Panama is 8.52; Costa Rica, 5.61; Mexico, 4.76; and Colombia, 5.45.

important role in the country's economic growth and are expected to become even more-important in the future.

18. With regard to the actual usage of telephones, traffic generated by telephones assigned to business and professional groups accounts for about 60 percent of all usage. 1/ The rapidly increasing demand for telephones in industry and commerce is, to some extent, a result of the proliferation of small business concerns (with less than five employees) which are now estimated to employ nearly 40 percent of the non-agricultural labor force. Many of these are essentially household operations, and the availability of telephones is important for improving communications and thus the output and efficiency of these enterprises.

19. The pattern of national long distance telephone traffic reflects the

dominance of San Salvador in the country's economy. In some small communities, 70 percent of all long distance calls are directed to San Salvador. In larger towns the proportion varies between 35 and 45 percent.

20. As a result of ANTEL's drive to increase the rate of telephone connections, initiated in 1975, local telephone service had increased to 68,300 lines of exchange equipment with about 54,700 mostly automatic connections at the end of 1976. Additionally, El Salvador's long-distance network was expanded to 1,600 circuits with automatic long-distance dialing between all automatic exchange areas.

21. Investment in telecommunications is expected to amount to ₡151 million during 1978-82. As a result, the telephone density is expected to increase to 2.22 telephones per 100 persons by 1982, still low by Latin American standards, but a substantial improvement over the present situation. In the SSMA, the telephone density is expected to increase by 35 percent while outside the SSMA the telephone density is expected to increase by 78 percent over the same period. During 1978-82, significant improvements are expected in the quality of local services, satisfying the needs primarily of industrial and commercial users and the first steps will be taken to provide services to rural areas in the country and to low-income urban areas--both of which are currently poorly served.

C. Housing, Urban Development and Community Development

22. In 1976, over 40 percent of the population of El Salvador lived in urban areas, and the SSMA had more than 720,000 inhabitants or about 18 percent of the country's total population. Another 12 percent lived in the four largest secondary cities: Santa Ana (166,000), San Miguel (128,000), Sonsonate (102,000) and Usulutan (95,000).

1/ This figure understates business-related usage because a significant number of telephones which are categorized as residential are used for busines purposes.

ANNEX A

23. Public and private housing production in towns and cities averaged only 2,600 units per year during 1960-70, while 10,000 new households were formed annually in urban areas. In 1972, census figures registered the urban housing stock at about 270,000 units, nearly two thirds of which were in the five largest cities. Homes needing improvement or replacement were estimated at 147,000 or about 55 percent of the existing stock. About two-thirds of these units were occupied by households earning less than the equivalent of US$100 per month. Although most urban homes (84 percent in 1975) had electricity, 69 percent lacked individual water supply and 62 percent lacked sewerage connections. In addition, low quality materials and poor construction methods contributed to the rapid physical deterioration of the housing stock.

24. Approximately three quarters of the population of metropolitan San Salvador resides in squatter settlements ("tugurios") typically located in public rights-of-way, in unauthorized subdivisions on privately-owned land, or in tenements ("mesones"). Population growth rates in these areas exceed those of the city as a whole and may reach 15-20 percent in certain locations. Most unauthorized sub-divisions are without services because owners are unable to obtain the necessary development permits required for electrical, water,

and sewerage connections.

25. Fundacion Salvadorena de Desarrollo y Vivienda Minima (FSDVM) is the only private organization actively involved in low-cost housing. FSDVM is a private, non-profit entity created in 1970 to improve the living conditions of the lowest-income groups, especially in squatter settlements. FSDVM has achieved this objective through self-help serviced site projects and related programs. In addition, FSDVM has worked in close collaboration with the Direccion del Desarrollo de la Comunidad (DIDECO, formerly FOCCO) of the Ministry of the Interior, the Government's community development agency, which carried out its projects with government supplies of physical inputs and community free labor.

26. Instituto de Vivienda Urbana (IVU) is the oldest public institution operating in the housing market. This agency was established in 1950 to provide dwelling units for low and middle income households. Until the mid-1960s, IVU, with meager resources, carried out limited programs, building relatively high standard houses. In the mid-1960s, international support from IDB enabled IVU to expand its operations significantly. Although costs per unit were lowered, dwellings were still beyond the reach of the lower urban income groups. In the early 1970s, IVU became increasingly involved with housing for lower income groups through squatter upgrading projects. A recent administrative restructuring and change in management is expected to result in improved and expanded executing capacity for the agency. IVU's 1978-82 plan provides for 25,000 new and rehabilitated units in urban areas of El Salvador, nearly 60 percent of which are targeted for families with monthly incomes below the equivalent of US$100.

27. To provide adequate housing facilities for industrial and commercial

workers, the Government established Fondo Social para la Vivienda (FSV) in 1973.

ANNEX A

All registered industrial and commercial employees are members of the system, and there are now about 150,000 workers participating. FSV is funded through a 5.5 percent payroll tax on wages and salaries of employees included in the social security system and by a Government capital contribution. FSV directly purchases houses from private developers and resells them to its contributors. As a result, housing financed through FSV has been beyond the reach of FSV's lower income members. To meet the needs of these groups, FSV would need to finance some lower standard projects such as self-help serviced site projects.

28. Other agencies operating in the housing sector are the Financiera Nacional de la Vivienda (FNV) which is the regulatory agency of the savings and loan system, Instituto Nacional de Pensiones para los Empleados Publicos (INPEP), the Government employees pension fund and the Instituto Salvadoreno de Seguro Social (ISSS), the social security fund.

29. Aside from the work carried out by FSDVM, investments presently underway or planned by public agencies and government departments for the San Salvador metropolitan area are thus far proceeding in a largely uncoordinated fashion and without reference to the urban development plan for the city completed by the Government in 1968 with assistance from AID. Several of the housing finance institutions are engaged in the construction of housing which requires a proliferation of supervisory staff. Other institutions,

which are primarily engaged in construction, such as IVU, try to arrange their own financing without sufficient linkages to existing financial institutions.

An urban study was initiated on September 13, 1976, with the United Nations Development Programme (UNDP) financing and the World Bank as the executing agency. The study has prepared recommendations and legislative guidelines to facilitate: (i) land acquisition for public development purposes; (ii) adoption of tax measures to curb land speculation; (iii) urban planning and implementation of such plans; and (iv) strengthening of institutions financing and executing housing programs. In addition the study has recommended a major squatter upgrading project to be executed during 1978-1982, which is expected to improve conditions for 28 percent of San Salvador's low-income families. The total cost of the project is estimated at d4I million over this period.

30. Investments for housing, urban and community development by the public sector (of which about 40 percent will be financial) is expected to average about 8 percent of total public investment in the 1978-82 period, which is considerably higher than the 3.1 percent of the 1973-77 period. Of this investment, low-income housing (including upgrading) is expected to represent about 20 percent of the total public investment in the sector.

31. Urban development infrastructure projects include several urban road projects, including the improvement of access roads to the national and inter-national road network. In addition, the Direccion de Urbanismo y Arquitectura (under the Ministry of Public Works) is planning a substantial investment (0245 million) during the 1978-82 period in major roads, major drainage works and erosion control. However, no comprehensive master transport plan exists at the urban level, and signs of traffic congestion are beginning to be visible in San Salvador.

ANNEX A

D. Water Supply and Sewerage

32. Overall, only 46 percent of the total households of El Salvador were supplied with public water in 1975. The urban areas 1/ had a service level of about 88 percent and the rural areas about 26 percent, of which only about 4 percent had individual house connections. Urban coverage levels can be broken down further into service to the SSMA and other urban areas. In the SSMA 75 percent of the households have individual or communal house connections, and 22 percent other public systems; in other urban areas, only 60 percent have individual or communal house connections,and 25 percent are served by other systems (see Table I below). Existing water supplies are not sufficient to meet fully the demand even with the present limited number of connections; consequently, rationing is widespread. Water sources are sometimes polluted, and locally operated systems lack the necessary funds, personnel and implementing capacity to maintain and improve service. Sewerage service levels through house connections are even lower than those for water supply; in urban areas, some 39 percent are served directly by water-borne sewerage systems and 27 percent by septic tanks or latrines. In the rural areas,service is entirely provided by latrines. Sewerage in urban areas is discharged without treatment so that receiving bodies of water tend to be highly polluted and in many cases are not suitable for other uses, including agriculture.

Table 1: HOUSEHOLD WATER SUPPLY SERVICE LEVEL, 1975

(in percentages)

	Total	Urban SSMA	Other Urban	Rural
Individual house connection	19.0	38.9	45.6	34.0	3.5
Communal house connection	13.0	27.3	29.2	26.0	2.0
Public standpipes	14.4	20.2	21.5	19.2	9.9
Private wells	6.9	1.5	-	2.7	11.0
Communal wells	14.9	2.2	0.3	3.5	24.8
Tanks	1.6	0.2	0.3	0.2	2.6
Others	30.2	9.6	3.0	14.4	46.2
Total	100.0	100.0	100.0	100.0	100.0

Source: Planning Ministry, Household Survey, April-July 1975

1/ The definition of urban areas used in El Salvador is an administrative one, where urban areas are all those being administrative centers. Many of these would be considered predominantly rural if judged from the standpoints of population density or size.

ANNEX A

33. Administracion Nacional de Acueductos y Alcantarillados (ANDA) is the government agency responsible primarily for urban water supply and sewerage. Its function includes planning, construction, operation and maintenance of water supply and sewerage systems throughout the country. At present, it is responsible for 135 urban water supply systems (including San Salvador),

30 rural water supply systems and 63 urban and rural sewerage systems. Other government agencies in the sector include the Ministerio de Salud Publica y Asistencia Social de El Salvador (MSP) through the Division de Sanidad Ambiental (DSA), and the rural water supply and engineering division, which plan and build rural water supply and excreta disposal systems throughout the country. By 1970 the Ministry of Health had constructed water supply systems in 274 communities, serving 210,000 persons. The systems are operated by local water boards with the assistance of DSA, which also carries out health education programs and a latrine program. In addition, the Direccion del Desarrollo de la Comunidad (DIDECO) of the Ministry of the Interior has undertaken small rural water supply and sewerage programs. (The functions of the Ministry of Health and the investment program for water supply and sewerage in the rural areas is discussed under the Health and Welfare section of this Annex A.) The Ministerio de Obras Publicas (MOP) has also been marginally involved in the sector through their urban housing activities. An inter-institutional committee representing ANDA, MSP and DIDECO coordinates sector activities.

34. By 1982, ANDA plans 100 percent coverage of water supply service in urban areas, by increasing the number of individual house connections by 33 percent over the 1975 level and by expanding the number of public stand-pipes. Sewerage and sanitation service levels in urban areas through house connections are expected to reach 50 percent by 1982, versus 36 percent coverage in 1975.

35. Based on estimated values of per capita costs, an investment of about 0300 to 1350 million (US$125 to US$150 million in current prices) would be required during 1978-1982 to achieve the service goals outlined above.

Approximately two-thirds would be for water supply and the remainder for sewerage. The planned fixed investment of only 0302 million (US$121 million) is below estimated investment needs. The goals for urban areas outside of Metropolitan San Salvador appear largely unobtainable, even if the Government's projected level of investment is implemented. Planned investment levels for these areas are less than one-half of the investment levels needed to achieve the service goals outlined above. In the SSMA, a high level of investment is feasible during 1978-82, since several water supply and sewerage projects are well advanced. Of these, the Zona Norte Project, currently in progress, is the largest. This 0364 million (US$145 million) water supply scheme will tap a ground water source located along the northern slopes of the San Salvador volcano. When fully implemented in 1984-85 this two-phase scheme should satisfy demand in the capital until 1988. In sewerage, projects for the San Salvador Metropolitan area include: improvement of the self-purification characteristics of the sewerage-carrying streams, expansion of the sewerage collection system, and feasibility studies for a sewerage treatment plant. Total investment in 1978-82 is about 77 million (US$31 million).

36. ANDA has significantly improved its financial performance during the last few years but its inadequate tariff structure preclude self-sufficiency in the short run. Efforts should continue to increase tariff levels, both for ANDA and independent municipalities, to strengthen their financial capacity.

In addition, the tariff structure should reflect a more equitable distribution of charges between users in the urban areas. Through the existing tariff structure, charges -to low-income households are nearly double those for the high-income households and seven times those for middle-income households.

37. Increased sector investments are contingent upon an adequate number of trained staff; there is presently a shortage of specialized engineers with experience in water supply and wastewater treatment. In addition, available personnel should be adequately compensated to attract and retain qualified staff. Furthermore administrative and sub-professional personnel should be given additional or specialized training.

E. Health and Welfare

38. Responsibility for health care (including rural water supply and sanitation) lies mainly with the Ministry of Health and Social Services and the Social Security Institute (ISSS), which has seven urban clinics and one hospital in San Salvador. The Ministry of Health delivers health services through a many-tiered system of hospitals, health centers, units and posts, and additionally through vaccinations and mobile community posts. The country is divided into five regions for administrative purposes and all health facilities, excepting the hospitals, are the responsibility of the Operative division of the Ministry of Health; the Ministry's 14 hospitals, although autononous administratively, report directly to the Vice Minister and are independent of the regional health centers. (This arrangement has in the past created difficulties in developing an adequate national referral system). Three of the five health regions possess health centers; each one represents the chief regional center for medical consultations, deliveries and hospitalization, for epidemic and communicable disease control, and for

health education. The next tier in the hierarchy are the health units which provide outpatient consultation, infant and child care, prenatal care, and are responsible for environmental sanitation, public health education, and for monitoring morbidity conditions and disease outbreaks. In 1977, there were 84 health units distributed throughout the five regions mentioned above. Finally, the health posts function as the lowest levels of attention available to the community. The posts serve as providers of primary care for minor illnesses and engage in substantial preventive care activity, including family planning, vaccinations and in some cases have food supplement programs. Working in close association with these posts are community-based paramedical workers who provide basic curative and preventative health, family planning and nutrition services and make referrals as required to other care levels.

39. The San Salvador Metropolitan Area with 16 percent of the country's population has 36 percent of the hospitals, about 50 percent of the hospital beds, 44 percent of the medical personnel, and 48 percent of the physicians. The quality of services is also significantly different with lower level units

of health delivery situated in the less urbanized areas, which show lower utilization rates. The relative dispersion of the rural population, the attractiveness of towns for medical personnel, and the high cost associated with building large facilities help explain those results. The 1978-1982

Development Plan emphasizes the training of a large number of rural health aides in the rural communities who would strengthen the referral system and improve health education, especially in the family planning, building latrines, sanitary food preparation, child care, and would generally stimulate self-help and community participation for improvement of health status. In addition, the 1978-82 investment program includes a large project for the construction and equipping of four new hospitals in urban areas and additional health centers. The latter would have a very positive impact in health coverage of the less urbanized areas, but by themselves will not solve the shortage of medical and paramedical staff in these areas.

40. An analysis of El Salvador's high mortality and morbidity statistics clearly indicates that lack of environmental sanitation is the most serious health problem facing the country. This problem mainly reflects the inadequacy of water supplies, waste disposal, latrinization, pest and pesticide control and health education. A major effort is required to provide these services in both rural and urban areas. Lack of suitable water supply is a particularly serious problem because of the high agricultural pollution of surface water. As noted in para. 35, projects are currently underway to meet the expected water demand in the San Salvador Metropolitan Area but in urban areas outside the San Salvador metropolitan area and, in particular, in rural areas, projected investment is clearly insufficient to meet the needs in these areas.

41. The Ministry of Health has the main responsibility for providing water supply and latrinization in rural areas. About 41 percent of the rural population presently has access to safe water either through house connection (about 4 percent) or through public standpipes (about 37 percent).

The majority of these systems have been developed since 1970. In line with its responsibilities, the Ministry of Health plans, by 1978-1982, to secure safe water for 60 percent of the rural population, mostly through public standpipes, and to raise the percentage of house connections from about 4 percent in 1975 to about 5 percent. Based on estimated per capita costs for this type of service to rural areas, an investment of about US$40 to US$60 million (in current prices) would be required during the 1978-1982 period to achieve these goals. The investment projections on Table 5.20, Statistical Appendix, show a total fixed investment for rural water supply of only about US15 million for the period through IDB- and AID-financed projects. Thus, unless considerably more effort is made to accelerate project identification and preparation for rural areas, which reflect realistic financing and implementation constraints, the goals set out by the Ministry will be largely unmet.

42. The provisions for sewerage services and pollution control are also inadequate. Substantial industrial and agricultural pollution of water sources exists, with the resulting destruction of aquatic life (particularly in the coastal areas). The public investment program for water and sewerage

in urban areas was discussed in paragraphs 35 above. In the rural areas, where the service is entirely provided by latrines, only 17 percent of the rural population is served. In these areas, the Government plans to increase the coverage to about 38 percent by 1982, with an investment of about

US$5 to US$10 million, a totally achievable goal, but further efforts are needed to secure access to sewerage services to a higher percentage of the rural population.

43. The demographic trends, policies and prospects are discussed in Section II of this report. The Government's 1978-1982 plan moves beyond previous government statements in this area by citing a demographic goal which is to reduce population growth from 3.3 percent to about 3.0 percent by 1982. To that end, the program includes increased activities in family planning, population education, communication, but does not address the need for programs or policies in other sectors (which provide basic services) that could affect or influence fertility.

F. Education

Formal Education:

44. Basic education in the formal system consists of nine years equally divided into three cycles; and secondary education (grades 10-12) permits specialization in academic subjects, commerce, administration, pedagogy, industrial and vocational arts, agriculture, hotel and tourism, navigation and fishery, and health. Higher education is provided by two autonomous universities, one national and one private, and by various post-secondary institutions. The Ministry of Education and Culture is responsible for administration of all levels except higher education.

45. The Government began systematic planning of the development of its education and training sector in the 1960s, with the adoption of the First Education Development Plan 1968-72. The First Plan had ambitious aims: (a) restructuring of the education system to provide nine years of basic education free of charge for every child, and diversified secondary school

programs rather than the traditional academic courses; (b) strengthening administration and educational supervision; (c) providing low-cost learning materials and introducing educational television; (d) rationalizing the teacher training system; and (e) increasing educational opportunities for the rural population. Although basic education expanded rapidly (6 percent per annum) under the First Plan, it covered only 66 percent of the relevant age group 7-15 years) by 1972, and the imbalance in educational opportunities between urban and rural areas was not corrected. Also, the diversification of secondary education, the revision of curricula and the provision of low-cost learning materials was not completed. Nevertheless, basic improvements in the institutional framework for formal education were established with the regionalization of school supervision, the introduction of educational television, and the establishment in the Ministry of Education of the Technical and Pedagogic Studies Department, the Textbook Production Workshop, and the Office of Planning and Coordination.

ANNEX A

46. The Second Education Development Plan 1973-77 supported continuation of the reform measures introduced under the First Plan and contained some new programs to meet the needs of the productive sectors and improve the quality and efficiency of the formal education system. Pursuant to this Plan, basic education opportunities in the rural areas are being extended to cover 70 percent of the relevant age-groups through construction of new schools and

more efficient utilization of existing ones. The rural schools are being converted into community learning centers to launch a basic skills training program for the rural population and an accelerated basic education course for over-age students. In addition, practical subjects are being taught along with basic education and the introduction of diversified curricula into secondary education is being completed.

47. The Government faces the challenging task of improving quality and efficiency of the educational system. Revised curricula have still to be reflected in new textbooks and educational materials; low salaries do not attract high calibre teachers; there is a need for intensive in-service training; repetition and drop-out rates are high; the limited coverage and high unit cost of educational television have thwarted its original objective of reaching the rural areas in a cost-effective manner to support unqualified teachers; and except those from a few private schools, graduates of the diversified secondary program (550 industrial, 190 agricultural, and 3,000 commercial students in 1974) have not yet reached the goals set out in the Plan, either in numbers or in level of training achieved. The secondary program has suffered mainly from insufficient allocation of funds for recurrent expenditures, unqualified teachers and inadequate selection of students. On the basis of an AID-assisted sector study, the Government has prepared its Third Education Development Plan (1978-82). The objectives of the Plan will be to further strengthen the formal education system, with particular emphasis on improved access to basic education and on quality improvements at both primary and secondary levels. The program will continue the expansion of basic education opportunities in rural areas through construction of new primary schools and more efficient utilization of existing ones.

Through this project the present deficit of 5,000 classrooms in rural areas would be reduced by 1,169 classrooms. In addition, physical facilities would be used in two shifts. The program will also include development of educational materials, training of teachers (particularly of primary school teachers), diversification of the academic secondary school program, and the expansion of technical institutes. The planned total investment for the 1978-1982 period in formal education (excluding universities and technical institutes) is of the order of 0140 million (US$56 million), with a total sector investment of V302 million (US$121 million), considerably greater than the 0110 million (US$44 million) invested in the sector during the 1973-1977 period.

Non-Formal Training:

48. In the last 20 years the population has doubled and the proportion under 15 years of age increased from 41 percent to 46 percent. At present, about 37 percent of the total labor force is illiterate. Illiteracy is

particularly high in the rural sector (56 percent) and, together with the low level of educational attainment, constitutes a barrier to the diffusion of modern techniques in agricultural and livestock production. There is thus a large and growing need to expand basic, practically oriented education for the adult labor force, particularly in the rural areas. There is also a pressing need to reinforce rural extension and training services to provide farmers and

rural workers with modern production techniques. With respect to the modern sectors, it would also be necessary to strengthen training services, especially of skilled and semi-skilled workers, to meet the manpower requirements of existing industry, and to give El Salvador's labor force the skills necessary to attract investment for new labor-intensive industries.

49. Assuming that the economy would grow at 4-5 percent a year, with the agricultural sector growing less rapidly and industry and infrastructural services at a faster pace, it is estimated that average annual requirements for additional manpower (including replacements) would be on the order of 5,000 professionals and technicians, 14,000 office and sales workers, 18,000 agricultural workers and 15,000 skilled and semi-skilled workers. On the supply side, the formal education system would provide mainly 2,000 professionals, 8,700 office and sales workers, and about 2,400 industrial workers. Since the formal system is not designed to meet fully the requirements for new trained manpower, let alone provide the necessary substantial upgrading of the existing pool of manpower to enhance its productivity, the first priority, at this stage, for human resource development in El Salvador has been to organize systematic nonformal training programs to supplement the formal education system.

50. The new administration which took office in July 1977 has recognized the need to reshape the vocational training system to support the country's development. The first task has been to delineate the major spheres of responsibility of each ministry in the field of vocational training. As a result, the Ministry of Labor is now responsible for all industrial training for skilled occupations in the organized modern sector. Operational emphasis is placed on worker upgrading through both in-plant training and institutional

training in fixed centers. The Ministry of Economy, through the National Productivity Center (CENAP), concentrates on management training, consulting and information services. The Ministry of Agriculture, through the National System of Agricultrual Training (CENCAP) and the National Center of Agriculture and Livestock Technology (CENTA), coordinates and implements non-formal agricultural training and diffuse modern technology to farmers. The Ministry of Education's role is to undertake nonformal basic education and training for the urban and rural poor. During 1978-1982, projects (resulting in a total investment of US$21 million) designed to support each of the Ministries' programs in non-formal education are in the process of implementation. Through short courses approximately 12,000 small-medium size farmers and almost 6,000 workers per annum would receive training (partially filling the projected gap of 15,000 industrial workers per annum). In addition, almost 4,000 rural and urban poor per year will receive basic occupational skills training.

ANNEX A

G. Agriculture

51. El Salvador is divided into three relatively distinct agricultural zones: (a) the Coastal or Southern Zone, which is heavily cultivated with export crops such as cotton, sugarcane and coffee and in which 19 percent of the nation's total rural population resides; the Central Zone, traditionally the center of economic development of the country, in which 55 percent of the rural population resides, and which is also heavily cultivated with export

crops; and the Northern Zone which is the poorest and least developed area of the country and which is topographically rugged and the least fertile area. Although about 26 percent of the total rural population resides in this zone, an estimated 50 percent of their aggregate income is obtained largely through seasonal work in the Coastal or Southern Zone.

52. Agricultural production has a dualistic pattern. Export agriculture is heavily dominated by large farm units (over 50 ha.) which produce about 81 percent of the cotton crop and 62 percent of the coffee and sugarcane crops. Medium-sized farm units (10 to 50 ha.) are also active in export agriculture producing about 26 percent, 19 percent and 13 percent of the coffee, sugarcane and cotton outputs, respectively. On the other hand, the small-size farms (below 10 ha.) produce a very small share of export crops, and depend predominantly on basic grain crops for domestic consumption. Currently El Salvador is self-sufficient in basic grains, but production has been uneven as a result of irregular climatic conditions. Livestock output has remained virtually stagnant in recent years. The country's exports of beef meat to the U.S. in 1976 amounted to about 21 percent of total national slaughter. El Salvador is a large importer of dairy products, mostly powdered milk.

53. Agricultural policy, until the late 1960s, was mainly concerned with incentives for the promotion of exports. Little attention was given to the small farmer. In the early 1970s this policy outlook began to change and a more developmental approach was adopted which took into account income distribution issues, the low productivity of small-size farms and the need for increasing the supply of staple foods. It was recognized that the increase of productivity is closely related to land tenure, that limited availability

of agricultural land in relation to a fast growing population was a determining factor and that increases in agricultural output could mainly come from a more intensive land use resulting in higher productivity.

54. Within this new policy, four major programs have been initiated during the last seven years: irrigation, small farm credit, agrarian reform and basic grains marketing. As a result of difficulties in implementing land tenure legislation, the impact of the agrarian reform program on income distribution and rural employment generation has been limited. Moreover, the Government's recent effort to create a Land Bank (COFINTA) has run into considerable opposition. COFINTA would provide long-term credit on concessionary terms for small farmers or cooperatives to finance the purchase of suitable agricultural land. In addition, the irrigation policy is constrained by its links to changes in land tenure (paragraph 61, below). Consequently,

from an agricultural sector viewpoint, two main policy tools appear to be now available to the Government for dealing with the rural povaity issuc Lt small farm credit activities of the Banco de Fomento Agropecuario (BFA), and the basic grain marketing activities of the Institute Regulador de Abastecimiento (IRA).

55. Until four years ago, small farmers in El Salvador had only limited access to institutionalized agricultural credit. Financing of agricultural activities had been almost exclusively in support of export crops through

commercial banks and some specialized agencies. Since 1973, with the establishment of the Agricultural Development Bank (BFA), credit to small farmers at concessional rates is now available. BFA is divided into three separate divisions, each one covering a different target group or task. Through these divisions, credit is extended to large and medium-scale farmers through the banking division and to small-scale farmers through the socio-economic and trust fund divisions. Through the latter two divisions, BFA has participated in basic grain promotion programs. In addition to extending credit to basic grain producers, BFA also provides growers with technical assistance, distributes improved seeds and works closely with IRA. Through 1976, BFA lending activities have expanded at an annual rate of 12 percent. Administrative and performance targets set for BFA have generally been met ahead of schedule and defaults have been kept at the relatively low level of about 5 percent. Despite BFA's impressive administrative and growth performance, it still reaches considerably less than 10 percent of the farms of less than 10 ha. BFA is attempting to expand its coverage and reduce its administrative costs in working with small farmers by extending credit through cooperatives and other small farmer groupings.

56. The Regulatory Supply Institute (IRA) is an autonomous government agency responsible for regulating basic grain prices. Until very recently IRA's effectiveness had been curtailed by its lack of storage capacity, and working capital. As a result, basic grain prices have fluctuated widely. Through an AID-financed Basic Grain Storage project initiated in 1973, storage capacity is now available to purchase 20 percent of grain marketings, the minimum amount required to maintain price levels. The one potential problem still remaining is the lack of sufficient working capital.

57. The Agrarian Reform Institute (ISTA) was created in 1975 and is responsible for the implementation of land reform projects. The first project, covering an area of 60,000 ha, was located in the San Miguel-Usulutan region. The project included a large-scale irrigation scheme covering 21,000 ha. Expropriations of the land was contemplated through partially deferred payments. About 12,000 farmers were to be settled in the area. In late 1976, the land expropriation provisions of the law were successfully challenged by large landholders and a modified law made expropriation a lengthy and complex process; thus, the project could be no longer implemented. In December 1977, the agrarian reform law was again modified, enabling ISTA to purchase land anywhere in the country, for distribution to small farmers, at ongoing market prices and in cash and the original integrated regional development approach was abandoned; however, so far ISTA has not prepared a program for the areas to be purchased. At the same time, a rural real estate tax of 1 percent per

year was levied on the value of agricultural property valued at more than 0200,000. Related to the agrarian reform issue is also a 1974 land rental law which aims at stabilizing and formalizing rental agreements and at the same time giving incentives for soil conservation. According to the law, rental contracts should have a minimum duration of three years and payments are established in relation to the value and use of the land. So far this legislation has not been effective as its implementation has proved difficult.

58. In addition to the legal constraints, which make the implementation of agrarian reform difficult, ISTA's objective of providing 5 ha. to every farm family is ultimately limited by the fact that there simply is not sufficient arable land in El Salvador. Furthermore, although ISTA has the final authority over agrarian reform projects, it must coordinate the activities of a number of other agencies in the agriculture sector whose views, interests and priorities may not always coincide with ISTA's.

59. In spite of the above indicated difficulties, the agricultural sector's continued growth will be crucial to the nation. Four major areas will be of critical importance to continued sectoral growth over the next decade. These are: a continuation of land reform activities, an expansion in cropped area using pastureland, improvement in crop yields, and greater attention to land conservation (erosion prevention). The latter is particularly serious in the mountainous areas of the Central and Northern Zones, where steeply graded lands have been deforested and planted in basic grains (often through BFA-financed credit). Part of this problem is related to land tenure patterns which have left vast holdings underutilized while forcing small farmers to utilize the ecologically sensitive mountainsides. With respect to land reform, distribution of land may be expected to bring about a more intensive use of the land, but would additionally have a long-term favorable impact upon what is at present a very narrow domestic consumer market.

60. All of these developments will require a significant increase in public sector expenditures in the agricultural sector. This expansion is contemplated under the 1978-1982 Development Plan, particularly in land reform, irrigation and agricultural credit to small farmers. As shown in Table 5.20 public fixed investment in the agricultural sector is estimated at 13

percent of total public fixed investment, which compares favorably with the 7.1 percent invested in the 1973-1977 period. When financial investment is included, planned public investment in agriculture is estimated at almost 25 percent of total public investment, the largest percentage of any one sector.

61. As shown in Table 5.20, the specific projects to be completed or initiated during 1978-1982 have been selected to address the various issues outlined in the previous paragraphs. Of these, the largest single project would be the expansion of BFA activities, representing over one third of total public investment in the sector. The General Directorate for Irrigation and Drainage (DGRD) of the Ministry of Agriculture and Livestock (MAG) has two main development programs: four large-scale irrigation schemes with a total area of about 72,000 ha (all in the coastal plain) and ten small projects with a total area of about 6,600 ha. (Implementation of all four large irrigation

projects is unlikely as it will require basic changes in land tenure since their location is in land with highly concentrated ownership). 1/ Accordingly, the investment program 1978-82 includes only two large-scale irrigation schemes: the San Miguel-Usulutan and the Ahuachapan irrigation projects (V49 million and 136 million, respectively). Other large investments planned are: expansion of IRA storage facilities (V24 million), livestock development (V72 million), and the deep sea fishing port for the Golfo de Fonseca (VI50 million), for which French Government financing has been secured. Still at the planning

stage are two integrated rural development schemes for Chalatenango and Morazan-La Union, three extremely underdeveloped areas of the country.

H. Industry and Commerce

62. During 1978-82, the Government's industrial objective is to rapidly increase industrial production, particularly for exports to third market countries. The country's ability to achieve its development objectives in the next few years would be closely related to the success in making significant progress on the following issues:

(i) restoring the private investor's confidence;

(ii) providing the necessary long-term credit assistance to industry on a timely basis:

(iii) providing adequate incentives to attract foreign investors;

(iv) actively promoting exports in third-market countries as a source of employment and foreign exchange;

(v) training the needed skilled manpower.

63. Although the planned Government programs for industrial development correctly emphasize fiscal incentives and credit availabilities, infrastructure support through free zones, industrial parks, and streamlined port facilities and freight terminals, creation of basic industries (steel, metal mechanics, chemical and construction materials), labor training, technical assistance and other measures to support industrial growth two and markets outside CACM, the pace of these programs is too slow to have significant impact over the medium term. Clearly, greater efforts are needed. Planned fixed public investment in industry during 1978-82 represents about 8 percent of total public fixed investment, or slightly below the average for 1973-77. The Government is also aware of the need to strengthen industrial policy formula-

tion and coordination of the different entities working on the sector, within a clear legal framework. The creation of a permanent Secretariat is under consideration with specific policy and coordination responsibilities.

1/ The only experience of the public sector in developing and administering large irrigation projects is the 4,000 ha Zapotitan project of which about 3,000 ha are being irrigated.

ANNEX A

Industrial Credit

64. With regard to industrial credit, long-term loans are in short supply and Government efforts are needed to improve this situation. About 80 percent of industrial credit is short term, and only about 7 percent of the loans have a maturity over five years. These longer-term loans mainly represent on-lending of special credit lines from BCR, including Fondo de Desarrollo Economico (FDE). The existing short-term nature of credit for industry slows down growth in the manufacturing sector. Moreover, during 1972-77, about 79 percent of total industrial loans were provided by the commercial banking system, headed by the Central Bank (BCR). The remainder originated with development finance institutions, namely the Instituto Salvadoreno de Financiamiento Industrial (INSAFI), Financiera de Desarrollo e Inversion, S.A. (FDI), and the Fondo de Financiamiento y Garantia para la Pequena Empresa (FIGAPE). (See paragraphs 20 and 21 of the main text.) The relatively large role played by short term loans of the commercial banks,

without attention to the Government's priorities, could result in the proliferation of industries with limited developmental impact, geared primarily for rapid payback periods in order to repay short-term loans of the banking system.

65. INSAFI has played a relatively minor role in the recent past in industrial financing; this is in part attributable to financial and managerial problems, originating from the conversion of lending capital into equity, and from taking over the management of floundering enterprises. The Government, however, is planning to restructure INSAFI.

Industrial Proiects

66. During 1978-82, major emphasis would be given to the development of a steel plant, petroleum-based chemical industries, metal-based industries, and construction materials, with a view to marketing these products mainly in the home market and other CACM areas. The Government is also planning to decentralize manufacturing by establishing several industrial parks and free zones in major urban areas and other strategic locations outside San Salvador.

67. An investment of approximately V157 million is planned for the installation of a sponge iron plant near the port of Acajutla, with a processing capacity of about 84,000 metric tons per year. This investment represents approximately 30 percent of the planned public investment in industry for the period. The plant would extract iron from ferrous sands in coastal areas which would be marketed as raw material for existing and planned metal industries which would be otherwise dependent on rather erratic supplies of scrap-iron. The feasibility of this plant should be carefully evaluated.

68. The Government is also planning a major expansion of the chemical industry, of which the ammonia-urea fertilizer plant in the Acajutla area 1/ would be the largest (dl57 million). Fertilizer consumption has increased at

1/ Based on a regional fertilizer development plan outlined in a SIECA (1972) study.

an annual rate of about 9 percent in the CACM during the 1961-76 period. The Government plans to use imported nafta and heavy oil as raw materials. The feasibility of this plant should also be carefully evaluated.

69. The 1978-1982 Plan also includes the development of industrial parks and free zones in San Salvador (San Bartolo), Comalapa (adjacent to the new Cuscatlan airport), Acajutla, La Union, San Miguel and Santa Ana. Investment (mostly for infrastructure) would be about □134 million. The development of free trade zones would help accelerate the establishment of labor-intensive assembling processes for foreign industries. In the recent past a number of foreign industries have been attracted by favorable tax legislation and/or availability of cheap labor.

I. Tourism

70. Tourism in El Salvador has been expanding rapidly over the past five years. The number of visitors more than doubled between 1970 and 1976, and foreign exchange receipts from tourism accounted in 1976 for about 3 percent of total exports.

71. The Ministry of Economy administers tourism development, chiefly through the Instituto Salvadoreno de Turismo (ISTU). ISTU is primarily responsible for policy formulation, identification and planning of tourism invest-

ment, promotional activities, and stimulation of handicraft production. ISTU's impact, however, has been limited to promotional activities and the development of a few scattered tourist centers.

72. The Government's 1978-82 investment in the tourism sector is about 076 million (about 2 percent of total fixed investment), of which 43.0 million is for the construction of expansion of new tourist centers in various department and beaches. Given the potential for expanding tourism receipts and the related employment effect, the amount allocated to the sector appears to be low.

73. A regional study financed by CABEI identified the beaches of the Gulf of Fonseca and El Cucu for priority tourist development in El Salvador. ISTU commissioned the consulting firm of Robert Nathan Associates, Inc., to carry out a feasibility study for the planned development of two sites. The studies have been completed, but no specific projects are scheduled in the 1978-82 public investment program, while private investors are beginning to promote several hotel complexes in the areas selected by the study which do not conform to the study's proposals. Government participation in the development of these and other sites may be crucial to ensure adequate infrastructure facilities and orderly growth in order to attract a large number of tourists from industrialized countries.

STATISTICAL APPENDIX

Table Number

I. POPULATION AND EMPLOYMENT

1.1 Basic Census Data, 1950-71.

1.2 Distribution and Density of Population, 1950-71.

1.3 Municipalities with Urban Populations Greater than 5,000 in 1971.

1.4 Number of Municipalities in El Salvador by Number of Inhabitants in the Urban Area, According to Department.

1.5 Urban Population Growth in Ten Municipalities of the SSMA.

1.6 El Salvador - Nutritional Status.

1.7 Total Population, School-Age Population (Grades 1-9) and Actual Enrollments by Department, 1978.

1.8 Health Services by Region, 1978.

1.9 Urban Population Served by ANDA in 1978.

1.10 Actual and Projected Age Distribution of the Population, 1950-2000.

1.11 Projected School-Age Population, 1975-2000.

1.12 Labor Requirements of the Main Agricultural Products.

1.13 Employment Needs by Crops.

1.14 Agricultural Labor Force, 1971.

1.15 Labor Force Participation Rates, 1971.

1.16 Employment in Metropolitan San Salvador.

1.17 Labor Force Projections, 1980-2000.

1.18 Labor Supply and Demand Projections, 1980-2000.

II. NATIONAL ACCOUNTS

2.1 Gross Domestic Product by Expenditure, 1960-78

2.2 Gross Domestic Product by Expenditure, 1960-78.

2.3 Gross Domestic Product by Sector, 1960-78 (in current colones).

2.4 Gross Domestic Product by Sector, 1960-78 (in millions of 1962 colones).

2.5 Gross Fixed Capital Formation by Major Sector, 1960-78.

2.6 GDP Projections, 1979-82.

III. BALANCE OF PAYMENTS AND EXTERNAL TRADE

3.1 Balance of Payments, 1969-78.

3.2 Exports, 1960-69/78.

3.3 Imports, 1960-78.

3.4 Summary of Imports, 1965-77.

3.5 Exports and Imports by Destination and Origin, 1960-77.

3.6 Trade with other Central American Countries, 1960-77.

3.7 Balance of Payments Projections, 1979-82.

3.8 Exports Projections, 1979-82.

3.9 Import Projections, 1979-82.

IV. EXTERNAL DEBT

4.1 External Public Debt Outstanding including undisbursed as of Dec/31/77. Debt Repayable in Foreign Currency and Goods.

4.2 Service Payments, Commitments, Disbursements and Outstanding Amounts of External Public Debt.

4.3 External Public Debt Outstanding including undisbursed as of Dec/31/77. Debt Repayable in Local Currency.

4.4 Service Payments, Commitments, Disbursements and Outstanding Amounts of External Public Debt.

V. PUBLIC SECTOR FINANCES

5.1 Summary of Central Government Cash Operations, 1970-78.

5.2 Central Government Cash Revenues, 1970-79.

5.3 Central Government Cash Expenditures, 1970-79.

5.4 Central Government Cash Expenditures by Ministries, 1970-79.

5.5 Central Government Budget Expenditures by Function, 1970-77.

5.6 Performance of the Central Government, 1960-78.

5.7 Summary of Autonomous Institutions and Public Enterprises Operations, 1970-76.

5.8 Revenues of Autonomous Institutions and Public Enterprises, 1970-76.

5.9 Expenditures of Autonomous Institutions and Public Enterprises, 1970-76.

5.10 Summary Accounts of Decentralized Public Sector Agencies, 1970-79.

5.11 Operating Surplus of Public Sector Agencies and Enterprises, 1970-79.

5.12 Summary Accounts of Local Governments, 1970-78.

5.13 Total Public Investments, by Sectors 1972-78.

5.14 Investment of Autonomous Agencies and Public Enterprises, 1970-79.

5.15 Public Financial Investment, 1972-79.

5.16 Public Sector Fixed Investment, 1965-78.

5.17 Central Government, Current Account Projections, 1979-83.

5.18 Public Sector Projections, 1979-83.

5.19 Public Employment, 1971-78.

5.20 Summary of Fixed Public Investment, 1978-83.

VI. MONEY AND CREDIT

6.1 Summary Accounts of the Consolidated Banking System, 1970-77.

VII. AGRICULTURE

7.1 Gross Value-Added in Agriculture Sector, 1961-78.

7.2 Area, Production and Yields of Major Crops, 1965-66 - 1977-78.

VIII. INDUSTRY

8.1 Gross Value-Added in Manufacturing Sector, 1965-78.

8.2 Manufacturing Hourly Wage rates in Selected Countries.

8.3 Manufacturing Wages and Exchange Rates for Selected Countries.

8.4 Manufacturing Industries Operating Under the Central American Agreement on Fiscal Incentives.

8.5 Firms under the Export Promotion Law, 1971-78.

8.6 Industrial Exports, 1971-77.

8.7 Industrial Exports to Central America, 1968-1977.

8.8 Industrial Exports to Third Countries, 1971-1977.

IX. PRICES

9.1 National Consumer Price Index by Expenditure Category, 1965-77.

9.2 Wholesale Price Index by Main Commodity Group, 1960-78.
